Enable charger

Weak AC input

Stop after excessive bulk

Lithium batteries

Configured for VE.Bus BMS

Battery type: No corresponding default

Charge curve Fixed

Absorption voltage 56.80 V Repeated absorption time 1.00 Hr

Float voltage 56.00 V Repeated absorption interval 7.00 Days

Charge current 70 A Absorption time 2 Hr

Stop charger below -20.5 deg C

56.8 (V)

56(V)

Value = Recommend charge Current x batteries installed

Battery system

Please select your system

- System uses OPzS or OPzV batteries
- System uses Gel or AGM batteries
- System uses LiFePo4 batteries with a VE.Bus BMS
- System uses LiFePo4 batteries with a two-signal BMS
- System uses LiFePo4 with other type BMS
- [This can be either a BMS connected via CAN bus or a BMS system in which the batteries are protected from high/low cell voltages by external equipment.]
- System uses Redflow ZCell batteries

Dynamic cut-off

This assistant uses so called dynamic cut-off.
That is, the 'DC input low shut-down' level depends on the battery discharge current.

There will normally be no need to adjust the curve used for this!
Just accept below values which are already optimized for the selected battery type.

In rare cases it might be advantageous to modify the curve. This can be done by changing the values below.

Note:
* Because dynamic cut-off is used, the "DC input low shut-down" related parameters in VEConfigure are ignored.

0.005 C	=	49.00 V
0.25 C	=	49.00 V
0.7 C	=	49.00 V
2 C	=	49.00 V

49 (V)

Restart offset

When inverting is stopped due to low battery, the battery voltage must rise above a certain level before inverting is allowed again.

This level is determined as an offset to cut-off(0).
(cut-off(0) is the cut-off voltage corresponding with a DC discharge of 0A.)

Note:

This same value is used as an offset to the cut-off voltage to determine the low bat Pre-Alarm indication)

Inverting is allowed again when voltage rises V above cut-off(0).

Default value 1.2
