CCGX - Developer migration notes for swupdate

What is swupdate?

swupdate is the name of the tool we use for image updates. Image updates? Yes, previously the CCGX firmware updates were all done with packages. Not anymore, finally!

For the advantages, see: swupupdate-project#features-for-in-the-change-log.

To learn more background and details, read the rest of that same page.

What has changed for developers?

- the set-feed.sh script is now here: `/opt/victronenergy/swupdate-scripts/`
- the root-password will be removed after every anupdate. ssh keys will be maintained! So that is what you should use!
- everything not in the /data partition will be removed after an update
