

GX product family

Introduction

A Venus-device is the communication-centre of your installation. It connects the components together and ensures they are working in harmony. Monitoring of live data, and changing settings is performed via our free-to-use Victron Remote Management Portal ([VRM](#)).

The GX product family consists of the different Venus-devices; each suitable for their own best type of system. Besides that there are accessories which can be used to extend the functionality.

The Venus devices are:

- Color Control GX
- Venus GX
- Octo GX - The Octo GX is the best fit for installations that have many MPPT Solar Chargers, as it has 10 VE.Direct ports
- CANvu GX - The CANvu GX is best used when IP67 rating is a must.

Available accessories

- [GX GSM](#) - A cellular modem, connects to Venus-device via USB and takes a simcard
- [WiFi USB sticks](#)
- [Energy Meters](#) - Measures PV Inverter Output for types of PV Inverters that cannot be read-out directly. And used as a grid meter in an [Energy Storage System \(ESS\)](#).
- [VE.Can resistive tank sender adapter](#) The VE.Can resistive tank sender adapter allows a standard resistive tank level sender to connect to the Venus-device.

Automotive	E4-10R-053535	In progress	?	?

Notes:

1. The maximum number of VE.Direct devices: on a CCGX is 5 (2 normal and 3 via USB). On a Venus GX is 6 (2 normal and 4 via USB). On a Octo GX is 10 (10 normal, no USB). VE.Direct ports on a Venus-device are isolated.
2. Though the CCGX has no built-in WiFi it can easily be added by attaching a USB-WiFi dongle. See [CCGX Manual, section 1.4.2](#) for details.
3. The built-in WiFi in the Venus GX has a very low signal strength - unfortunately. The strength is sufficient for connecting to a phone, tablet or laptop in order to access setup and monitoring. But to connect the Venus GX to the internet either use the built-in Ethernet port or add a USB-WiFi dongle. See [CCGX Manual, section 1.4.2](#) for details. Make sure the Venus GX is running v2.06 or later - the first shipment of Venus GX units ran v2.05.
4. Though the hardware of the Venus GX and Octo GX have a Bluetooth Smart chipset inside; it doesn't work properly and they are unfixable. Bluetooth Smart for Venus-devices is coming but not using those built-in chipsets.
5. Larger SD memory cards (SDXC) are not supported. SD cards can be used for two purposes:
 1. Logging data, see [this section in the ccgx manual for details](#).

2. Updating firmware, see [this section in the ccgx manual for details](#).
6. The second CANbus port is accessible via the GND, CAN-H and CAN-L terminals. Note that the port is not Isolated. See Settings → Services for configuring that port.
7. The programmable relay can be set to act as an alarm relay, [automatic genset start stop](#), or an on/off switch, and is controlled via the GUI and/or ModbusTCP.
8. In the Venus GX hardware there are two relays - at present only one of them is available for use.
9. The tank level inputs are resistive and should be connected to a resistive tank sender. Victron does not supply tank senders. The tank level ports can each be configured to work with either European (0 - 180 Ohm); or US tank senders (240 - 30 Ohm).
10. The Venus GX has two temperature terminals which can be used to measure & monitor all kinds of temperature-inputs. Temperature senders are not included. The required sensor is ASS000001000 - Temperature Sensor QUA/PMP/Venus GX. (Note that this is not the same as the BMV temperature accessory.)
11. Octo GX comes with a small Wifi antenna. It is possible to replace it by any other Wifi antenna having a RP-SMA connector.
