

Victron Energy Storage Systems

Grow your business. Even when the grid doesn't grow with you.

You have plans. Heavier machinery, electric company vehicles, expanding your premises. But when you apply for a different grid connection, you discover there are thousands of businesses in the queue ahead of you. With a Victron Energy Storage System, you bypass that queue and take control yourself: you get more power from your existing connection, maximise your solar use, cut your energy bills, and ensure continuity during outages. Energy that matches your ambition, every time - that's the power of 50 years of Victron know-how.

No compromises on operations

Run your full load without scheduling around your connection. Your battery ensures demand peaks never disrupt your business.

Lower operating costs, automatically

When grid prices are low, your system charges itself. When they rise, it draws from the battery instead, continuously reducing your energy overheads without any intervention.

An alternative for generators

Silent, emissions-free, and maintenance-free. A Victron ESS outperforms a diesel generator in many applications, without the fuel costs, noise, or upkeep.

Instant backup when the grid goes down

Critical systems switch to battery power automatically. Processes, equipment, and communications keep running without interruption.

Optimal energy rates, 24/7

Secure system, Dutch design

Controls smart devices

More comfort, more independence

victron energy
BLUE POWER

Built in. From day one.

Future-proof by design

With Victron ESS already installed, your property adapts as your business grows. New equipment, additional electric vehicles, expanded operations, whatever your future energy demands, your infrastructure is ready for them.

Back to simplicity

No load scheduling. No decisions about what equipment to run and when. The ESS monitors energy prices automatically, charging when electricity is cheap, drawing from the battery when it isn't. It can also control connected equipment like lighting and machinery, activating loads at the optimal moment without manual intervention.

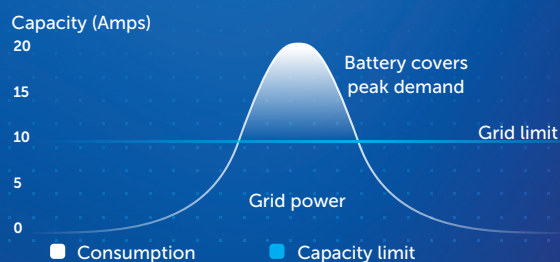

Always informed

Your ESS comes with free access to VRM: Victron's Remote Management portal. It presents a real-time view of your site's energy flows, consumption, and solar generation on any device. VRM also allows the installer to check your system remotely and provide help, without having to plan a service appointment.

What comes with your property, at a glance

- Full operational capacity without load compromises
- Automatic backup if the grid goes down
- Maximum return from your solar installation
- Lower energy costs, managed automatically
- A silent, clean, maintenance-free alternative to generators
- Ready for whatever your business demands next

Capacity over time - Peak shaving
