## 12. Appendix

...................................................................................... 38
1. Safety Precautions

1.1. Safety Warnings Lynx Distribution System

- Do not work on live busbars. Ensure that the busbar is unpowered by disconnecting all positive battery poles prior to removing the Lynx front cover.
- Work on batteries should be carried out by qualified personnel only. Observe the battery safety warnings as listed in the battery manual.

1.2. Transport and Storage

Store this product in a dry environment.

The storage temperature should be: -40°C to +65°C.

No liability can be accepted for damage in transit if the equipment is not transported in its original packaging.
2. Introduction

2.1. The Lynx Smart BMS

The Lynx Smart BMS is a dedicated Battery Management System for Victron Lithium Smart Batteries. It contains a positive and a negative busbar, a BMS, a contactor and a battery monitor. It is part of the Lynx Distribution system.

The Lynx Smart BMS has a status LED and a Bluetooth LED. The Lynx Smart BMS can communicate via Bluetooth with the VictronConnect app and can communicate via VE.Can with an GX device.

The Lynx Smart BMS - with and without cover

The Lynx Smart BMS ships together with two VE.Can RJ45 terminators.

Two RJ45 VE.Can terminators

2.2. VictronConnect App

The Lynx Smart BMS and up to 4 connected Lynx Distributors can be monitored and setup with the VictronConnect App.

For more information see the VictronConnect App download page and the VictronConnect manual.

2.3. GX device

The Lynx Smart BMS and up to 4 connected Lynx Distributors can be monitored with a GX device.

For more information on the GX device see the GX device product page.

The GX device can be connected to the VRM portal allowing for remote monitoring. For more information on the VRM portal see the VRM page.
2.4. Lithium Smart Batteries

The Lynx Smart BMS is a dedicated BMS for the Victron Energy range of Lithium Smart batteries. These batteries are lithium iron phosphate (LiFePO4) batteries and are available in 12.8V or 25.6V and in a variety of capacities. They can be connected in series, parallel and series/parallel so a battery bank for system voltages of 12V, 24V or 48V can be created. Up to four 12.8V batteries or two 25.6V batteries can be connected in series. Up to 5 batteries or battery series strings can be connected in parallel.

For more information about these batteries see the Lithium Smart battery product page.

2.5. The Lynx Distribution System

The Lynx Distribution System is a modular busbar system that incorporates DC connections, distribution, fusing, battery monitoring and/or Lithium battery management. For more information also see the DC Distribution Systems product page.

The Lynx Distribution System consist of the following parts:

- **Lynx Power In** - A positive and negative busbar with 4 connections for batteries or DC equipment.
- **Lynx Distributor** - A positive and negative busbar with 4 fused connections for batteries or DC equipment together with fuse monitoring.
- **Lynx Shunt VE.Can** - A positive busbar with a space for a main system fuse and a negative busbar with a shunt for battery monitoring. It has VE.Can communication for monitoring and setup with a GX device.
- **Lynx Smart BMS** - For use together with Victron Energy Smart Lithium batteries. It contains a positive busbar with a contactor that is driven by a battery management system (BMS) and a negative busbar with a shunt for battery monitoring. It has Bluetooth communication for monitoring and setup via the VictronConnect App and VE.Can communication for monitoring with a GX device and the VRM portal.
3. Features

3.1. Internal parts and wiring diagram Lynx Smart BMS
The internal physical parts and the wiring diagram of the Lynx Smart BMS indicating the following parts:

- Positive busbar
- Negative busbar
- Contactor
- Shunt

3.2. Contactor
The contactor is situated in the positive busbar.

It protects the batteries when the ATC (allowed to charge) and ATD (allowed to discharge) signals fail and the battery voltage becomes too low or too high. It is only opened by the BMS in critical situations. In normal use it's always closed.

The contactor can also be used as a system on/off switch driven by the remote on/off signal.

- The contactor closes when the Lynx Smart BMS is powered, the batteries are okay and the remote on/off switch is switched on.
- The contactor opens when the Lynx Smart BMS is de-powered, when there is an issue with the battery or when the remote on/off switch has been switched off.

3.3. Remote on/off switch
The remote on/off connection terminals can be used to remotely switch the Lynx Smart BMS on or off.
When the Lynx Smart BMS is switched off the following happens:

- The ATC (allowed to charge) and ATD (allowed to discharge) signals are turned off, so that all loads and chargers are turned off.
- When the battery current is low enough the contactor will open so that the DC system is disconnected from the batteries.
- The AUX terminal will de-power so that a connected GX device will also de-power.
- The Lynx Smart BMS goes into hibernation mode.
- Bluetooth will remain active.

There are 3 ways to operate the remote on/off feature:

- A switch wired between the L and H pins. When the switch is open, the Lynx Smart BMS is off and when the switch is closed, the Lynx Smart BMS is on.
- A switch wired between the battery positive (or a voltage exceeding 2Vdc) and the H pin. When the switch is open, the Lynx Smart BMS is off and when the switch is closed, the Lynx Smart BMS is on.
- A switch wired between the battery negative (or GND) and the L pin. When the switch is open the Lynx Smart BMS is off and when the switch is closed Lynx Smart BMS is on.

3.4. Pre-charge circuit

The Lynx Smart BMS is equipped with a pre-charge circuit. This will pre charge capacitive loads such as inverters or inverter/chargers before the contactor closes.

Checks are performed during pre-charge cycle. If the connected load is less than 20 Ohm, the current is too large or if pre-charge is taking too long, the contactor will not close and an error will be generated.

If a pre-charge error has occurred, the Lynx Smart BMS will wait for 30 seconds and then will try again try to perform a pre-charge. It will repeat this for maximum of 20 times.

The lynx Smart BMS pre-charge circuit has more advantages than other BMS designs that simply use a fuse.

3.5. Fans

The Lynx Smart BMS has two built-in fans. These turn on shortly during startup, when the loads are pre-charged.

In normal operation the fans will also turn on when:

- The temperature exceeds 60°C (140°F).
- The current exceeds 320A.
- The dissipation in the contactor is too high (to prevent contactor overheating).

3.6. Battery Management System

Pre-alarm

The Lithium Smart battery sends a pre-alarm signal to the Lynx Smart BMS when one of its cell voltages drops below a set threshold. The pre-alarm voltage threshold is set in the battery via the VictronConnect app.

When the Lynx Smart BMS receives a pre-alarm signal, it will activate its alarm relay and it will generate an alarm message. The alarm message is generated at least 30 seconds before the loads are shut down via the ATD signal.

A requirement for pre-alarm to be active, is that batteries are used that support this feature. Older batteries did not have this feature. To check if the battery is equipped with pre-alarm; connect to the battery with the VictronConnect app and see if the pre-alarm feature is supported by the app. If the pre alarm setting is missing from the VictronConnect app, then the battery does not support pre-alarm.

A shutdown of the DC system can cause a safety risk. This is especially the case in a boat. Always make sure to act on a pre-alarm warning, for example turn on a generator, so that the batteries are recharged.

Allow-to-charge and Allow-to-discharge

The Allow-to-charge and Allow-to-discharge contacts control the chargers and loads in the system:

- When the battery is fully charged and the battery voltage gets too high or the temperature is too low, the allow-to-charge contact is opened and charging has to stop.
- When battery voltage is low, the BMS adds a 30s delay before opening ATD if pre-alarm is not supported. An alarm message will be sent immediately.

For this feature to operate correctly, it is essential that the loads and chargers are able to be controlled by the allow-to-charge and allow-to-discharge signals. Ideally wire the signal to a devices remote on/off connector, or if that is not available a BatteryProtect or Cyrix-Li relay can be used.
The maximum current rating of the allow-to-charge and allow-to-discharge ports is 0.5A and the ports are protected by a resettable fuse.

**Charge and discharge control via DVCC**

If a GX device is connected to the Lynx Smart BMS and "DVCC capable" Victron devices are connected to the same GX device, the Lynx Smart BMS will control the charge and discharge functionality of these devices. This takes place via the GX device DVCC feature (Distributed Voltage and Current Control). It is then not necessary to wire the ATD and ATC contacts to these devices, the GX device connection is used instead.

The Smart Lynx BMS will control the following:

- Set the charge current and charge voltages of the connected devices
- Stop discharge when there is a low cell voltage or low battery voltage
- Stop charging when a cell voltage or the battery voltage is too high
- Stop charging when the battery temperature is too low or too high

**Contactor**

If charging or discharging is not stopped and the battery voltage gets even higher or lower, the safety contactor will open to disconnect the entire DC system. This will only happen when the batteries are critically low or when the batteries are being overcharged.

**3.7. Battery Monitor (shunt)**

The Lynx Smart BMS battery monitor operates in a similar fashion as the other Victron Energy battery monitors. It contains a shunt and battery monitor electronics.

Readout of the battery monitor data is via Bluetooth using the VictronConnect App or via a GX device or the VRM portal.

**3.8. Alarm relay**

The Lynx Smart BMS is equipped with an alarm relay that will activate in case there is an alarm. With the exception of choosing continuous or intermittent (0.8s on and 0.8s off) operation, the relay is not configurable.

The alarm relay will activate under these circumstances:

- Pre-alarm
- Any alarm or error

The alarm relay is an SPDT relay, this means that it has 3 contacts, Common (COM), Normally open (NO) and normally closed (NC). See below image.

![Alarm relay functionality](image)

**3.9. AUX connection**

The Lynx Smart BMS is equipped with an auxiliary power supply. This supply outputs the same voltage as the system battery voltage and is rated at a maximum continuous current rating of 1.1A and is protected by a resettable fuse.

The AUX output is active when the Lynx Smart BMS is powered up, is switched on via the remote on/off switch and when the batteries are okay.

The AUX output is inactive when the Lynx Smart BMS is un-powered, when the battery is almost empty (cell voltage below 2.6V) or when switched off via the remote on/off terminal.

It is recommended that the system contains a GX device, that it is powered from the AUX terminal. This so the GX device remains powered when the contactor is open.
Never power the GX device from the battery side or it will keep consuming power when the battery is low, when the battery voltage is low, which can cause damage to the batteries when they are further discharged.
4. Communication and interfacing

4.1. The VictronConnect App
The VictronConnect App communicates via Bluetooth. It is used for changing settings, monitoring the Lynx Smart BMS and up to 4 connected Lynx Distributors. For more information on the VictronConnect App see the VictronConnect manual.

4.2. GX Device
The Lynx Smart BMS can be connected to a GX device via VE.Can. The GX device will show all measured parameters, operational state, battery SoC and alarms.

4.3. VRM Portal
If the Lynx Smart BMS is connected to a GX device, and the GX device is connected to the internet, all measured parameters, operational state, battery SoC and alarms can be accessed remotely via the VRM Portal.

4.4. Lynx Distributor fuse monitoring
Up to 4 Lynx Distributors can be connected to a Lynx Smart BMS. They communicate via the RJ10 cable. The Lynx Distributors communicate fuse status and operational status to the Lynx Smart BMS. The Lynx Smart BMS can be used to read out the Lynx Distributors, generate alarms in case a fuse is blown or communication is lost.

4.5. DVCC
DVCC allows the Lynx Smart BMS to control Victron Energy inverter/chargers and solar chargers via a GX device.

The Lynx Smart BMS will automatically adjust discharge current, charge current and charge voltage depending on the battery state. For the action taken for each battery state, see below table.

DVCC is automatically activated. The following parameters are implemented:

Fixed parameters:
- Absorption voltage is set at 14.2V
- Storage/float voltage is set at 13.5V
- Max charge current is set at 1C
- Charge current at low cell voltage is set at 0.1C

User configurable via the VictronConnect app:
- Absorption time
- State of charge (SoC) threshold (A new charge cycle will be initiated as soon as the the battery state of charge drops below this threshold)
- Repeated absorption time (The number of days after which a new charge cycle is initiated, even though the battery state of charge is still above the state of charge threshold)

For more information on DVCC and to find out which Victron Energy products can be controlled via DVCC, see the GX device manual.

4.6. Actions taken when certain battery conditions occur

<table>
<thead>
<tr>
<th>Battery condition</th>
<th>Allowed to discharge signal</th>

<tr>
<td>A battery cell voltage is too low. This is a under-voltage alarm</td>
<td>Low</td>
<td>High</td>
<td>The discharge current is reduced to 0A. Once the under-voltage alarm is cleared it will be set back to 600A. The charge voltage is reduced until the charge current is 0.1C. Once the under-voltage alarm is cleared the charge voltage will go back to 14.2V (28.4V or 56.8V).</td>
</tr>
<tr>
<td>A battery cell voltage is too low and the temperature is too low (below 5°C)</td>
<td>Low</td>
<td>Low</td>
<td>The charge current is reduced by lowering the charge voltage to battery voltage minus 0.15V. This will reduce the charge current to 0A.</td>
</tr>
<tr>
<td>A battery cell voltage is too high or the temperature is too high and the battery voltage is below 13.5V (27.0V). This is interpreted as an over temperature alarm.</td>
<td>High</td>
<td>Low</td>
<td>The charge current is reduced by lowering the charge voltage to battery voltage minus 0.15V. This will reduce the charge current to 0A. Once the temperature alarm has been cleared the charge voltage will return to normal.</td>
</tr>
<tr>
<td>A battery cell voltage is too high or the temperature is too high and the battery voltage is above 13.5V (27.0V). This is interpreted as an over-voltage alarm. A probable cause is an unbalance in the battery cells.</td>
<td>High</td>
<td>Low</td>
<td>The charge current is reduced by lowering the charge voltage to battery voltage minus 0.15V. This will reduce the charge current to 0A. Once the over-voltage alarm has been cleared, the charge voltage will be set to 13.6V (27.2V). The charge voltage will increase by 0.2V increments once the charge current has dropped below 1.5A for 2 minutes. This is repeated until the charge voltage has reached 14.2V (28.4V) at which point the charge voltage will return to normal. This special charge sequence has been designed to rebalance the battery cells.</td>
</tr>
</tbody>
</table>

4.7. NMEA2000

Communication with a NMEA2000 network can be established via the Lynx Smart BMS VE.Can connection together with a VE.Can to NMEA2000 micro-C male cable.

Supported NMEA 2000 PGNs:
- Product Information – PGN 126996
- DC detailed Status – PGN 127506
- DC/Battery Status – PGN 127508
- Switch Bank Status - PGN 127501
- Status 1: Relay
- Status 2: Alarm
- Status 3: Battery voltage low
- Status 4: Battery voltage high

Class and function:
- N2K device class: Electrical generation
- N2K device function: Battery

For more information see the NMEA2000 & MFD integration guide.
5. System Design

5.1. Lynx distribution system parts

A Lynx distribution system consists of a single Lynx Smart BMS module.

Then, single, multiple or a combination of Lynx Distributor modules and/or Lynx Power In modules are added.

Together they form a continuous negative and positive busbar with DC connections and, depending on the configuration, integrated fuses, a battery monitor and/or lithium battery management.

5.1.1. Interconnecting Lynx modules

Each Lynx module can connect to other Lynx modules on the left side (M8 hole) and on the right side (M8 bolt).

If the Lynx module is the first in line, the last in line or is used by itself, it is possible to connect batteries, loads or chargers directly to these connections. However, we do not generally recommend this because additional insulation and fusing is needed.

The example below shows a Lynx system consisting out of a Lynx distributor, Lynx Smart BMS and another Lynx Distributor. Together they form a continuous busbar, with fused battery connections, battery monitor, BMS system, contactor and fused load connections.

5.1.2. Orientation of Lynx modules

If the Lynx System contains a Lynx Smart BMS, the batteries always have to be connected to the left side of the Lynx System and the rest of the DC system (loads and chargers) connect to the right side. This, so the battery state of charge can be correctly calculated.
From battery bank

To DC system, All DC loads and DC charge sources

Example of Lynx module orientation: the batteries connect to the left side and all loads and chargers connect on the right side.

The Lynx modules can be mounted in any orientation. Should they be mounted upside down, so that the text on the front of the units is upside down as well, use the special stickers are included with each Lynx module, so that the text is orientated the correct way.

Example of Lynx modules mounted upside down: the batteries connect to the right side, all loads and chargers connect to the left side and the upside down stickers are affixed.

5.1.3. System example - Lynx Smart BMS, 2x Lynx Distributor and lithium batteries

This system contains the following components:

- Lynx Distributor with 2 fused paralleled Lithium Smart batteries with identical cable lengths for each battery (up to 5 paralleled series strings can be used per system).
- Lynx Smart BMS with BMS, contactor and battery monitor.
- Lynx Distributor provides fused connections for inverter/charger(s), loads and chargers. Additional modules can be added if more connections are needed.
- A CCGX (or other GX device) to read out the Lynx Smart BMS and Lynx Distributor data.
5.1.4. System example - Lynx Smart BMS, 1x Lynx Distributor and lithium batteries

It is possible to connect the lithium battery directly to the input of a Lynx Smart BMS. This is useful if only a single Lithium battery or a single series string of lithium batteries is used.

When connecting batteries directly to the output of the Lynx Smart BMS make sure to fuse the incoming battery supply. Refer to the Lithium Smart Battery manual on how to fuse the battery bank.
5.1.5. System Example - Lynx Smart BMS only

For a very slim line system, the Lynx Smart BMS can be used just by itself. This is useful if the system contains a single Lithium battery or a single series string of lithium batteries together with a simple DC system.

Figure 1.

5.2. System sizing

5.2.1. Current rating Lynx Smart BMS

The Lynx Smart BMS is available in a 500A model.

The Lynx Smart BMS is rated to a specific current. Do not exceed this current rating.

The Lynx Smart BMS is equipped with an over-current protection. The 500A Lynx Smart BMS will allow 600A for 5 minutes. But as soon as the current or the time has been exceeded, an alarm will be generated. The contactor will not open. An over current alarm will be generated and ATC or ATD (depending on current direction) is disabled after 30s delay.

It is not possible to parallel multiple Lynx Smart BMS modules. Only a single Lynx Smart BMS can be used per system.

The table below gives an idea of how much power a Lynx Smart BMS is rated for at different voltages. This will give you an indication how big the connected inverter/charger system can be. Do keep in mind, that if inverters or inverter/chargers are used, both the AC and the DC system will be powered from the batteries.

Table 1. Current and power rating Lynx Smart BMS

<table>
<thead>
<tr>
<th></th>
<th>12V</th>

<td>12kW</td>
<td>24kW</td>
<td>48kW</td>
</tr>
</tbody>
</table>

A 1000A model will be added late 2021

5.2.2. Fusing

The Lynx Smart BMS does not contain a fuse. Fusing needs to be done externally. This can be done by connecting Lynx Distributor modules to the Lynx Smart BMS or by using external fuse holders and fuses.

Always use fuses with the correct voltage and current rating. Match the fuse rating to the maximum voltages and currents that potentially can occur in the fused circuit. For more information on fuse ratings and fuse current calculations see the Wiring Unlimited book.
The total value of the fuses of all circuits should not be more than the current rating of the Lynx module, or the Lynx model with the lowest current rating in case of multiple Lynx modules are used.

5.2.3. Cabling
The current rating of the wires or cables used to connect the Lynx Smart BMS to batteries and/or the DC loads has to be rated for the maximum currents that can occur in the connected circuits. Use cabling with a sufficient core surface area to match the maximum current rating of the circuit.

For more information on cabling and cable thickness calculations see the Wiring Unlimited book.
6. Installation

6.1. Mechanical connections

6.1.1. Lynx module connection features

The Lynx module can be opened up by unscrewing 2 cover screws.

The contacts on the left side are covered by a removable rubber sleeve.

Red is the positive busbar and black is the negative busbar.

Location of front cover screws and the removable sleeves

6.1.2. Mounting and interconnecting Lynx modules

This paragraph explains how to attach several Lynx modules to each other and how to mount the Lynx assembly into its final location.

For a mechanical drawing of the housing, with dimensions and the location of the mounting holes, see the appendix of this manual.

These are the points to take into consideration when interconnecting and mounting Lynx modules:

• If Lynx modules are going to be connected to the right and if the Lynx module is fitted with a plastic barrier on the right side, remove the black plastic barrier. If the Lynx module is located as the most right module, leave the black plastic barrier in place.
• If Lynx modules are going to be connected to the left, remove the red and black rubber sleeves. If the Lynx module is located as the most left module, leave the red and black rubber sleeves in place.
• If the Lynx system contains a Lynx Smart BMS or Lynx Shunt VE.Can, the left side is the battery side and the right side is the DC system side.
• Connect all Lynx modules to each other using the M8 holes and bolts on the left and right. Take care that the modules correctly slot into the rubber joiner recesses.
• Place the washer, spring washer and nut on the bolts and tighten the bolts using a torque of 14Nm.
• Mount the Lynx assembly in its final location using the 5mm mounting holes.
6.2. Electrical connections

6.2.1. Connect DC wires

This chapter might not apply if the Lynx module is connected to other Lynx modules, like can be the case for the Lynx Smart BMS or the Lynx Shunt VE.Can.

For all DC connections the following applies:

- All cables and wires connected to the Lynx module need to have been fitted with M8 cable lugs.
- Pay attention to the correct placement of the cable lug, washer, spring washer and nut on each bolt when attaching the cable to the bolt.
- Tighten the nuts with a torque moment of 14Nm.

6.2.2. Connect RJ10 cable(s)

These instructions only apply if the system contains Lynx distributor(s) together with a Lynx Smart BMS or a Lynx Shunt VE.Can.

There are two RJ10 connectors in each Lynx Distributor, one on the left and one on the right. See below drawing.

To connect the RJ10 cables between the various Lynx modules do the following:

- Plug one side of the RJ10 cable in the RJ10 connector of the Lynx distributor, with the retainer clip of the RJ10 connector facing away from you.
- Feed the RJ10 cable through the recess at the bottom of the Lynx Distributor, see above picture.
- To connect to a Lynx Smart BMS, plug the RJ10 cable into the RJ10 connector at the bottom of the Lynx Smart BMS.
6.2.3. Connect BMS cables

Connect the BMS cables from the Lithium battery to the BMS connectors on the Lynx Smart BMS.

Location of the BMS cable connectors

In case multiple batteries are used, first interconnect the battery BMS cables and then connect the BMS cable from the first and last battery to the BMS connectors on the Lynx Smart BMS.

If the BMS cables are too short use BMS extension cables.

6.2.4. Connect the Multi connector

The multi connector is the green connector situated on the bottom of the Lynx Smart BMS. The connector has 11 contacts. The contacts are numbered from left to right, starting with Pin 1, up to pin 11.

Table 2. Pin-out of the multi connector

</table>

The multi connector’s screw terminal can be pulled out of the Lynx Smart BMS, allowing for easy wiring.

The remote on/off (pin 10 and 11) of the terminal are interconnected with a wire loop. In case the remote on/off connection is used, remove the loop and wire as desired.

---

**6.2.5. Connect the GX device**

Connect the Lynx Smart BMS VE.Can port to the GX device VE.Can port using a RJ45 cable.

Multiple VE.Can devices can be interconnected, but make sure that the first and the last VE.Can device both have a VE.Can RJ45 terminator installed.

Power the GX device from the AUX + and AUX – terminal of the Lynx Smart BMS.
6.3. Configuration and settings

6.3.1. Power up for the first time

The Lynx Smart BMS will power up when a battery is connected to the battery terminals and the remote on/off switch is turned on (or the wire loop is placed in the remote on/off connections). This will be the case once the battery pole has been connected. Or the battery fuses have been placed.

On first power up (or after a reset to factory defaults) the Lynx Smart BMS will automatically determine the system voltage by measuring the battery voltage and stores this in its memory. In a system where multiple batteries have been connected in series, it is essential that each individual battery has been fully charged, prior to connecting them in series.

On first power up (or after a reset to factory defaults) the Lynx Smart BMS will also automatically detect if the connected battery is equipped with the pre-alarm hardware and stores this in its memory (Older batteries might not have pre-alarm hardware). It is essential that the battery BMS cables are connected to the Lynx Smart BMS before power up.

6.3.2. Update firmware

On a new install, it is recommended to update the firmware of the Lynx Smart BMS or its Bluetooth interface. If there is a newer firmware version available, the VictronConnect app will notify you of this as soon as a connection with the Lynx Smart BMS is made.

To check if the firmware is up to date or to manually update firmware, connect to the Lynx Smart BMS using the VictronConnect app and follow below steps:
Navigate to the product settings by clicking the "cog" 🛠 symbol in the top right hand of the product status screen.

Click on the "3 dots" ⚙️ symbol in the top right hand of the settings screen.

Select "Product info" from the pop-up menu.

The firmware version will be displayed. It is mentioned if this is the latest firmware version (or not). If a newer firmware version is available, an "UPDATE" button will be displayed.

To update the firmware, press the "UPDATE" button.

On a new install is also recommended to check and update the firmware of each connected Smart Lithium battery. This is done via Bluetooth using the VictronConnect app in a similar manner as described above.

### 6.3.3. Settings Lynx Smart BMS

Once powered up the VictronConnect app is used to make essential and custom settings.

#### Set battery voltage:

- This would have been detected automatically, but check it anyway, just to make sure.

#### Set battery capacity:

- Enter the battery capacity of the connected battery bank.

#### Set pre-alarm:

- Check if the pre-alarm is enabled. This would have been detected automatically, but check it anyway, just to make sure. Note that this setting is only available if the connected batteries have the necessary pre-alarm hardware. (older batteries might not have the pre-alarm feature).
- The pre-alarm voltage setting is set in the battery (not in the Lynx Smart BMS). If multiple batteries are used, the pre-alarm voltage setting needs to be set at the same value in each battery.

#### Alarm relay:

- The operation state of the Alarm relay can be set to continuous or intermittent operation. In intermittent operation the relay switches on and off every 0.8 seconds.

#### DVCC settings:

- The discharge current limit at pre-alarm setting is set by default set to "no". This can be changed to "yes".
- The absorption time is set by default to 2 hours. This can be adjusted if required.
- The state of charge (SoC) threshold is set by default to 70%. This is the threshold at which the Lynx Smart BMS starts a new full charging cycle. This can be adjusted if required.
- The repeated absorption time in days at which a new full charging cycle is started if the battery state of charge does not fall below the SoC threshold. The default is every 30 days and can be adjusted if required.

#### Battery Monitor settings:

- The charged voltage is the voltage at above which the battery monitor synchronises and resets the state of charge to 100%. For synchronisation to happen, the tail current and charged detection time conditions need to have been met as well. The default is set to 14.0V and can be adjusted if required.
- The tail current is the current at below which the battery monitor synchronises and resets the state of charge to 100%. For synchronisation to happen, the charged voltage and charge detection time conditions need to have been met as well. The default is set to 4.00% and can be adjusted if required.
- The charged detection time is the time passed after which the battery monitor synchronises and resets the state of charge to 100%. For synchronisation to happen, the charged voltage and charged current conditions need to have been met as well. The default is set to 3 minutes and can be adjusted if required.
6.3.4. Battery monitor settings

This chapter explains all battery monitor settings. In addition to this we also have a video available explaining these settings and how the interact with each other to achieve accurate battery monitoring for both lead-acid and lithium batteries.

https://www.youtube.com/embed/mEN15Z_S4kE

Special note on the Lynx Smart BMS battery monitor settings

Unlike other battery monitors, the Lynx Smart BMS battery monitor settings are mostly fixed settings and are not customizable. The reason for this is that the Lynx Smart BMS is always used together with Victron Energy Smart Lithium batteries and a lot of battery monitor parameters are therefore known because they relate to the battery type.

To give an overview of the status of each battery setting:

These battery monitor settings are adjustable:

- **Battery capacity**: by default set at 200Ah, needs to be set on first install.
- **Charged Voltage**: by default set at 14.0V (12V system), 28.0V (24V system) and 56.0V (48V system).
- **Tail current**: by default set at 4% (as a fraction of the battery capacity).
- **Charged detection time**: by default set at 3 minutes.

These battery monitor settings are automatic settings:

- **Zero current calibration**: is done automatically each time at power up.

These battery monitor settings are fixed:

- **Peukert exponent**: 1.05
- **Charge efficiency factor**: 99%
- **Current threshold**: 0.1A
- **Discharge floor**: 15%
- **Delta T**: 1
- **SOC cycle end**: 90%
- **SOC Cycle**: 65%
- **SOC full discharge**: 5%

The meaning of each battery monitor parameter is explained in next chapter.

**Battery capacity**

This parameter is used to tell the battery monitor how big the battery is. This setting should already have been done during the initial installation.

The setting is the battery capacity in Amp hours (Ah).
Charged voltage
The battery voltage must be above this voltage level to consider the battery as fully charged. As soon as the battery monitor detects that the voltage of the battery has reached the “charged voltage” and the current has dropped below the “tail current” for a certain amount of time, the battery monitor will set the state of charge to 100%.

<table>
<thead>
<tr>
<th>Default setting</th>
<th>Range</th>
<th>Step size</th>
</tr>
</thead>
<tbody>
<tr>
<td>200 Ah</td>
<td>1 - 9999 Ah</td>
<td>1 Ah</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Default setting</th>
<th>Range</th>
<th>Step size</th>
</tr>
</thead>
<tbody>
<tr>
<td>14.0V (12V system)</td>
<td>0 - 60V</td>
<td>0.1V</td>

<td>28.0V (24V system)</td>
<td></td>
<td></td>
</tr>
<tr>
<td>56.0V (48V system)</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The “charged voltage” parameter should be set to 0.2V or 0.3V below the float voltage of the charger.

Tail current
The battery is considered as “fully charged” once the charge current has dropped to less than the set “Tail current” parameter. The “Tail current” parameter is expressed as a percentage of the battery capacity.

Remark: Some battery chargers stop charging when the current drops below a set threshold. In these cases, the tail current must be set higher than this threshold.

As soon as the battery monitor detects that the voltage of the battery has reached the set “Charged voltage” parameter and the current has dropped below the “Tail current” for a certain amount of time, the battery monitor will set the state of charge to 100%.

<table>
<thead>
<tr>

<th>Range</th>
<th>Step size</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.00%</td>
<td>0.50 - 10.00%</td>
<td>0.1%</td>
</tr>
</tbody>
</table>

Charged detection time
This is the time the “Charged voltage” and “Tail current” must be met in order to consider the battery fully charged.

<table>
<thead>
<tr>
<th>Default setting</th>
<th>Range</th>
<th>Step size</th>
</tr>
</thead>
<tbody>
<tr>
<td>3 minutes</td>
<td>0 - 100 minutes</td>
<td>1 minute</td>
</tr>
</tbody>
</table>

Peukert exponent
The Peukert exponent for Lithium Smart batteries is 1.05. This is a fixed setting and cannot be changed.

Charge efficiency factor
The “Charge Efficiency Factor” compensates for the capacity (Ah) losses during charging. A setting of 100% means that there are no losses.

A charge efficiency of 95% means that 10Ah must be transferred to the battery to get 9.5Ah actually stored in the battery. The charge efficiency of a battery depends on battery type, age and usage. The battery monitor takes this phenomenon into account with the charge efficiency factor.

The charge efficiency factor for Lithium Smart batteries is 99% This is a fixed setting and cannot be changed.

Current threshold
When the current measured falls below the “Current threshold” value it will be considered zero. The “Current threshold” is used to cancel out very small currents that can negatively affect the long-term state of charge readout in noisy environments. For example, if the actual long-term current is 0.0A and, due to injected noise or small offsets, the battery monitor measures 0.05A the battery monitor might, in the long term, incorrectly indicate that the battery is empty or will need to be recharged. When the current threshold in this example is set to 0.1A, the battery monitor calculates with 0.0A so that errors are eliminated.

The current threshold is fixed at 0.1A

Discharge floor
The “Discharge floor” parameter is used in the time remaining calculation. The battery monitor calculates the time it takes until the set “discharge floor” has been reached. It is also used to set the state of charge alarm defaults.

The discharge floor parameter is fixed at 15%.

SoC cycle end
The state of charge cycle end setting is used to......

This setting is fixed at 90%.
SoC cycle
The state of charge cycle setting is used to .......
This setting is fixed at 65%.

SoC full discharge
The state of charge full discharge setting is used to .......
This setting is fixed at 5%.

6.3.5. Settings Lynx Distributor
These instructions only apply if the system contains a Lynx Smart BMS.

Each Lynx distributor must be addressed and set to A, B, C or D. This is done via a 2-way dip switch located inside the Lynx distributor. Refer to chapter 6.1.3. Addressing Lynx Distributor in the Lynx distributor manual.

Use the VictronConnect App to give each fuse a custom name (maximum 16 characters). If the fuse name is empty (0 characters), the fuse will be disabled from monitoring and be ignored.

• Navigate to the settings page by clicking the gear symbol at the top right-hand corner.
• On the settings page scroll down to the Lynx Distributor settings.
• Click on a fuse name and a window opens to rename the fuse.

Setting the Lynx Distributor fuse names using VictronConnect
7. Commissioning the Lynx Smart BMS

Commissioning sequence:

• Check polarity of all battery cables.
• Check cross sectional area of all battery cables.
• Check that each battery has the most up to date firmware.
• Check that if batteries have been connected in series, that each battery has been fully pre-charged (refer to battery manual).
• Check if all battery cable lugs have been crimped correctly. Check if all battery cable connections are tight (don’t exceed maximum torque). Tug slightly on each battery cable and see if the connections are tight.
• Check all BMS cable connections and make sure the connector screw rings are screwed all the way down.
• Check if each paralleled battery is fused or that each paralleled battery series string is fused.
• If a GX device is used, check if the VE.Can cables and terminator have been placed and the device is powered from the AUX voltage output of the Lynx Smart BMS.
• Power the Lynx Smart BMS by connecting the battery supply or placing the battery fuses and, if applicable, by switching the remote on/off switch to “on”.
• Check if the load pre-charge is completed and if the contactor closes and the loads are powered.
• Connect with VictronConnect and verify that the Lynx Smart BMS has the most up to date firmware and that all setting have been made, especially if the battery capacity is set correctly.
• Check that the system voltage has been set correctly.
• Check if the fuse names of the Lynx Distributor (if applicable) are correctly named.
• If a GX device is connected, check that it is powered from the AUX voltage output.
• Check that the Lynx Smart BMS displays correctly on the GX device. Check that DVCC has been enabled.
• Disconnect a random BMS cable and verify that the BMS is turning off all charge sources and all loads. Reconnect the BMS cable.
• Turn on a load and check that the current is a negative current displayed on the GX device or the VictronConnect app.
• Charge batteries fully and check that a 100% state of charge is displayed.
8. Operation Lynx Smart BMS

8.1. Powering up

The Lynx Smart BMS will power up when a battery is connected to the battery terminals and the remote on/off switch is turned on (or the wire loop is placed in the remote on/off terminal).

The power up sequence follows these steps:

- **System check**: A self-check together checking the connected batteries and Lynx Distributor modules.
- **Pre-charge loads**: The pre-charge circuit prevents very high inrush currents that can damage the contactor.
- **Contactor closes**: The Lynx Smart BMS is operational and the power to the Lynx distributor(s) is turned on.

**Hibernation mode**

The Lynx Smart BMS is in hibernation mode when the Lynx Smart BMS has turned itself off because of a low battery event or when it has been turned off via the remote on/off switch.

In hibernation mode, the contactor and most of the electronic circuits are turned off and the power consumption is very low (0.8mA). The status LED is off.

The power to the Lynx distributor(s) is turned off.

Bluetooth is still active during hibernation mode. The blue Bluetooth LED is either flashing every 3 seconds or is on, depending on whether there is an active Bluetooth connection with the VictronConnect app.

The Lynx Smart BMS will come out of hibernation mode when the remote on/off switch is switched on or the batteries are charged.

**Remote on/off switch**

The contactor is driven by the BMS and also by the remote on/off signal. This way the Lynx Smart BMS can act as main system on/off switch. For example, before leaving the boat or camper van, the system can be switched off so that the batteries are not further discharged. Although the power consumption in hibernation mode is very low, it is good practice to first fully charge the batteries before switching the system off. However, if the system is left for a very long time without being charged, it will be better to disconnect the positive battery pole.

**Operational**

Once powered up the contactor is closed. The green status LED and the blue Bluetooth LEDs on the Lynx Smart BMS and the green power LED on Lynx Distributor(s) are illuminated.

![Lynx Smart BMS LEDs]

8.2. BMS operation

The BMS in the Lynx Smart BMS communicates with the batteries and will safeguard them against under voltage and over voltage and low temperatures.

**Sleep mode**

The Lynx Smart BMS will go into sleep mode when one of the battery cells is low and no charge voltage has been supplied for 2 hours. The contactor and most internal electronic is turned off, status LED is off, the power consumption is very low (0.8mA). Bluetooth is still active and the blue LED is either on or flashing every 3 seconds depending on whether there is an active connection with the VictronConnect app.

The Lynx Smart BMS will come out of sleep mode when:

- A charge voltage is supplied to the system side of the Lynx Smart BMS 0.5V higher than the battery voltage.
- The battery voltage is higher than 12.8V (25.6V).
• The Lynx Smart BMS is switched off and then back on again via the remote on/off switch.

Standby switch via the VictronConnect app
This is a "soft" remote switch and is accessible via the VictronConnect app.

When the Lynx Smart BMS has been switched to standby mode, the contactor will be opened and the DC system will be disconnected. Bluetooth, VE.Can and the AUX port will remain active.

Pre-alarm
When the cell voltage drops and reaches the pre alarm threshold the alarm relay will activate. This will give an advanced warning of an impending empty battery and before the loads are disabled. Pre-alarm is indicated by the red LED flashing 3 times every 4 seconds.

Do not discharge
If the cell voltage becomes too low and if it has reached the low cell voltage threshold, the ATD contact (allowed to discharge) will turn off all loads. If the Lynx Smart BMS is connected to a GX device and DVCC is enabled, the inverters of the devices that are connected to the same GX device will be turned off as well.

BMS do not charge
If the cell voltage becomes too high and has reached the high cell voltage threshold, or if the low temperature threshold has been reached, the ATC contact (allowed to charge) will turn off all chargers. If the Lynx Smart BMS is connected to a GX device and DVCC is enabled, the chargers of the devices that are connected to the same GX device will be turned off as well.

BMS contactor operation
If the batteries are even further discharged or overcharged the Lynx Smart BMS will physically disconnect DC system from the batteries via the contactor. This to safeguard the batteries against total discharge or extreme overcharge. The contactor will also open if the ATC or the ATD signal have not worked and the Lynx Smart BMS has detected that current is still flowing into or out of the battery.

The contactor will re-engage after a low voltage event as soon as a suitable charge voltage is measured on the Lynx Smart BMS output (the system side).

The contactor will re-engage after high voltage event as soon as the cell voltage has dropped.

8.3. Battery monitor operation
The Lynx Smart BMS has a built-in battery monitor. It measures battery voltage and current. Based on these measurements it calculates state of charge, time to go and keeps track of historical data, such as deepest discharge, average discharge and number of cycles.

8.4. Battery care
Once the Lynx Smart BMS is in operation it is important to take care of the batteries.

These are the basic guidelines:
• Prevent total battery discharge at all times.
• Familiarize yourself with the pre-alarm feature and act when pre-alarm is active to prevent a DC system shutdown.
• If the pre-alarm is active, or if the BMS has disabled the loads, make sure that the batteries are recharged as soon as possible.
• Minimise the time the batteries spend in a far discharged state as much as possible.
• The batteries need to spend at least 2 hours in absorption charge mode each month to ensure sufficient time in balancing mode.
• When leaving the system unattended for some time, make sure to either keep the batteries charged during that time, or make sure the batteries are (almost) full and then disconnect the DC system from the battery. Do this by disconnecting the positive battery pole.

8.5. LED indications alarms and errors

LEDs
The Lynx Smart BMS is equipped with two LEDs, the “Bluetooth” LED and the “Status” LED. These LEDs will indicate the operation mode and the fault mode in case there is a fault.

### Alarm and error codes

The Lynx Smart BMS is equipped with Bluetooth for easy monitoring and setup via the VictronConnect app.

![Lynx Smart BMS status VictronConnect](image)
If the Lynx Smart BMS is connected to a GX device it can be monitored via the GX device and the VRM portal. This also includes receiving alarms signals.

![Lynx Smart BMS alarms on the VictronConnect App and GX device](image)

This is a list of the alarm and error codes. For an explanation of these alarms and what to do on case of one of these errors or alarms, consult the Troubleshooting and Support chapter [30].

9. Troubleshooting and Support

Consult this chapter in case of unexpected behaviour or if you suspect a product fault.

The correct troubleshooting and support process is to first consult the common issues as described in this chapter.

Should this fail to resolve the issue, contact the point of purchase for technical support. If the point of purchase is unknown, refer to the Victron Energy Support webpage.

9.1. Lynx Smart BMS does not power up

This can be caused by one of the following reasons:

**No battery supply**

No LEDs are illuminated on the Lynx Smart BMS. Check the battery supply voltage into the Lynx Smart BMS. Check cables and fuses on the battery side. It could also be that the Lynx Smart BMS is in hibernation mode. For more info on that see paragraph Powering up [25].

**Reverse battery supply**

Check the polarity of the supply voltage into the Lynx Smart BMS. If reverse polarity, correct polarity mistake. Unit should now power up.

**Remote on/off switched off or wire loop missing**

The remote on/off switch needs to be turned on (or the wire loop is placed in the remote on/off connections).

**Battery voltage issues**

The Lynx Smart BMS, on first install will auto detect the battery voltage. It will be set to either 12V, 24V or 48V. Each set voltage has a specific battery voltage range (threshold). If the Lynx Smart BMS measures a voltage that is outside this threshold one of these alarms will be generated:

- Probably wrong system voltage - the red LED flashing 7 times every 4 seconds.
  
  This is generated when the system voltage cannot be determined or when the DC system voltage is much higher than the set system voltage.

- Battery voltage not allowed - the red LED flashing 14 times every 4 seconds.

To fix, check the battery settings or check the battery voltage.

This table indicates the voltage thresholds for each system voltage:

<table>
<thead>
<tr>
<th>System voltage</th>
<th>Voltage threshold</th>
</tr>
</thead>
<tbody>
<tr>
<td>12V</td>
<td>Between 9V and 15V</td>
</tr>
<tr>
<td>24V</td>
<td>Between 16V and 30V</td>
</tr>
<tr>
<td>48V</td>
<td>Between 32V and 60V</td>
</tr>
</tbody>
</table>

**Pre-charge errors**

The Lynx Smart BMS pre-charges the connected load. Once pre-charge is complete, the contactor is closed and the Lynx Smart BMS is operational. There are two specific error that can be generated during the pre-charge process:

- Pre-charge high current – the red LED flashing 6 times every 4 seconds. The pre-charged energy or current has been exceeded.
- Pre-charge timeout – the red LED flashing 5 times every 4 seconds. It has taken too long for the pre-charge process to complete.

Pre-charge faults are mostly caused by:

- A short circuit on the load output – potentially caused by a malfunctioning load or if there is a wiring issue like a short circuit.
- Loads with a too high capacitance or too low resistance (less than 20 Ohm) have been connected to the load output.

To remedy these faults, switch off, or remove some loads or chargers and rule out wiring issues or short circuits.

**Internal error**

Contact your Victron supplier if one of the following errors are occurring:

- Internal supply error - Red LED flashing 12 times every 4 seconds
- Initialization error - Red LED flashing 9 times every 4 seconds
• Contactor failure - Red LED flashing 10 times every 4 seconds
• Hardware error - GX device alarm Calibration lost - GX device alarm
9.3.4. The pre-alarm setting is missing in VictronConnect

Pre-alarm is only available if the battery supports it. The current battery models all support it, but older batteries do not have the hardware necessary for the pre-alarm feature.

9.3.5. BMS is displaying alarm while all cell voltages are within range

A possible cause is a loose or damaged BMS cable or connector. Check all BMS cables and their connections.

First rule out that the cell voltages and temperature of all connected batteries are in range. If they are all in range, then follow one of the following procedures.

Also consider that once there has been a cell under voltage alarm, the cell voltage of all cells need to be increased to 3.2V before the battery clears the under voltage alarm.

A way to rule out if a fault is originating from a faulty BMS or from a faulty battery, is to check the BMS using one of the following BMS test procedures:

**Single battery and BMS check:**

- Disconnect both BMS cables from the BMS.
- Connect a single BMS extension cable between both BMS cable connectors. The BMS cable should be connected in a loop, as in below diagram. The loop tricks the BMS in thinking that there is a battery connected without any alarms.
- If the alarm is still active after the loop has been placed, the BMS is faulty.
- If the BMS has cleared the alarm after the loop has been placed the battery is faulty and the BMS is not faulty.

![BMS Test Procedure Diagram]

**Testing a Lynx Smart BMS by connecting a single BMS extension cable to both BMS cable connections**

**Multiple batteries and BMS check:**

- Bypass one of the batteries by disconnecting both its BMS cables
- Connect the BMS cables of the neighbouring batteries (or battery and BMS) to each other, effectively bypassing the battery.
- Check if the BMS has cleared its alarm.
- If the alarm has not been cleared, repeat this for the next battery.
- If the alarm is still active after all batteries have been bypassed, the BMS is faulty.
- If the BMS cleared its alarm when a particular battery was bypassed, that particular battery is faulty.

![BMS Test Procedure Diagram]

**Eliminating a BMS error by bypassing a suspect battery**

9.3.6. How to test if the BMS is functional

To test if the BMS is functional, disconnect one of the BMS cables and see if the BMS will go into alarm mode.
9.3.7. System in sleep or hibernate mode
This is indicated by the status LED off and the Bluetooth LED flashing every 3 seconds.

The Lynx Smart BMS goes into sleep or hibernation mode once the battery or a battery cell has been deeply discharged. The Lynx Smart BMS will conserve as much power as possible, to not discharge the battery much further. Bluetooth is still active, but other non-essential circuits are turned off, including the power to the Lynx Distributor(s).

Check the voltages of the connected batteries and if they are low, charge the batteries. As soon as the Lynx Smart BMS sees a charge voltage it will automatically re-activate and close its contactor to allow for battery charging.

9.3.8. Battery communication error
This is indicated by the red LED flashing 2 times every 4 seconds or with the GX device BMS cable error. A battery communication error occurs when the Lynx Smart BMS is not connected to the battery BMS communication cables, or if there is an issue with the BMS cables. To remedy this error, check the following:

- Check if both battery cables are connected to the Lynx Smart BMS.
- In case of a multiple battery setup, check if all batteries are interconnected.
- Check for loose connections, the male connector needs to screw “hand tight” into the female connector.

9.4. Battery monitor issues

9.4.1. Incomplete current reading
The negatives of all the loads and the charge sources in the system must be connected to the system minus side of the Lynx Smart BMS.

If the negative of a load or a charge source is connected directly to the negative battery terminal or the “battery minus” side on the Lynx Smart BMS, their current will not flow through the battery monitor and will be excluded from the overall current reading and the state of charge reading.

The SmartShunt will display a higher state of charge than the actual state of charge of the battery.
9.4.2. Incorrect state of charge reading

An incorrect state of charge can be caused by a variety of reasons.

Incorrect battery settings

The following parameter(s) will have an effect on the state of charge calculations if they have been set up incorrectly:

- Battery capacity

Incorrect state of charge due to a synchronisation issue:

The state of charge is a calculated value and will need to be reset (synchronised) every now and then.

The synchronisation process is automatic will be performed each time the battery is fully charged. The battery monitor determines that battery is fully charged when all 3 “charged” conditions have been met. The “charged” conditions are:

- Charged voltage (Voltage)
- Tail current (% of battery capacity)
- Charge detection time (minutes)

Practical example the conditions that need to be met before a synchronisation will take place:

- The battery voltage has to be above 13.8V
- The charge current has to be less than 0.04 x battery capacity (Ah). For a 200Ah battery this is 0.04 x 200 = 8A
- Both above conditions have to be stable for 3 minutes

If the battery is not fully charged or if the automatic synchronisation does not happen, the state of charge value will start to drift and will eventually not represent the actual state of charge of the battery.

The following parameter(s) will have an effect on automatic synchronisation if they have been set incorrectly:

- Charged voltage
- Tail current
- Charged detection time
- Not occasionally fully charging the battery

For more information on these parameters see the chapter: “Battery settings”.

Incorrect state of charge due to incorrect current reading:

The state of charge is calculated by looking at how much current flows in and out of the battery. If the current reading is incorrect, the state of charge will also be incorrect. See paragraph Incomplete current reading [33]

9.4.3. State of charge is missing

This means that the battery monitor is in an unsynchronised state. This can occur when the Lynx Smart BMS has just been installed or after the Lynx Smart BMS has been unpowered for some time and is being powered up again.

To fix this, fully charge the battery. Once the battery is close to a full charge, the battery monitor should synchronise automatically. If that doesn’t work, review the synchronisation settings.

9.4.4. State of charge does not increase fast enough or too fast when charging

This can happen when the battery monitor thinks the battery is bigger or smaller than in reality. Check if the battery capacity has been set correctly.

9.4.5. Synchronisation issues

If the battery monitor does not synchronise automatically, one possibility could be that the battery never reaches a fully charged state. Fully charge the battery and see if the state of charge eventually indicates 100%.

9.5. VictronConnect issues

Cannot connect with the VictronConnect App

It is highly unlikely that the Bluetooth interface is faulty. These are some pointers to try before seeking support:

- Is the battery voltage still high enough? If the battery voltage drops to a very low level, the Lynx Smart BMS will eventually turn its internal electronics off, including Bluetooth communication.
- Is there already another phone or tablet connected to the product? Only one phone or tablet can be connected at any given time. Make sure no other devices are connected and try again.
- Are you close enough to the product? In open space the maximum distance is about 20 meters.
• Are you using the Windows version of the VictronConnect App? The Windows version cannot use Bluetooth. Use an Android, iOS or macOS device instead.
• Has Bluetooth been disabled in the VictronConnect settings?
• Does VictronConnect have an issue? Try to connect to another Victron product, does this work? If that also does not work, then there probably is an issue with the phone or tablet. Refer to the troubleshooting section of the VictronConnect manual.

Pin code lost
If you have lost the PIN code, you will need to reset the PIN code to its default PIN code. This is done in the VictronConnect App.

• Navigate to the device list of the VictronConnect App. Click on the option symbol next to the product listing.
• A new window will open which allows you to reset the PIN code back to its default: 000000.
• Enter the batteries unique PUK code as printed on the product information sticker on the product.
• More information and specific instructions can be found in the VictronConnect manual.

Interrupted firmware update
This is recoverable, just try to update the firmware again.

9.6. GX device issues
This chapter only describes the most common issues. If this chapter does not solve your issue, consult the manual of the GX device.

Incorrect CAN-bus profile selected
Check that VE.Can is set to use the correct CAN-bus profile. Navigate to settings/services/VE.Can port and check if it is set to "VE.Can and Lynx Ion BMS 250kb.

RJ45 terminator or cable issue
VE.Can devices connect in "daisy chain" to each other and a RJ45 terminator needs to be used with the first and last device in the chain.

When connecting VE.Can device always use "manufactured" RJ45 UTP cables. Do not manufacture these cables yourself. Many communication and other seemingly unrelated product issues are caused by faulty home made cables.
10. Warranty

This product has a 5-year limited warranty. This limited warranty covers defects in materials and workmanship in this product and lasts for five years from the date of original purchase of this product. To claim warranty the customer must return the product together with the receipt of purchase to the point of purchase. This limited warranty does not cover damage, deterioration or malfunction resulting from alteration, modification, improper or unreasonable use or misuse, neglect, exposure to excess moisture, fire, improper packing, lightning, power surges, or other acts of nature. This limited warranty does not cover damage, deterioration or malfunction resulting from repairs attempted by anyone unauthorized by Victron Energy to make such repairs. Non-compliance with the instructions in this manual will render the warranty void. Victron Energy is not liable for any consequential damages arising from the use of this product. The maximum liability of Victron Energy under this limited warranty shall not exceed the actual purchase price of the product.
