MultiPlus (with firmware xxxx400 or higher)

12 | 3000 | 120 - 50 | 120V (PMP123021102)
24 | 3000 | 70 - 50 | 120V (PMP243021102)
1. SAFETY INSTRUCTIONS

In general

Please read the documentation supplied with this product first, so that you are familiar with the safety signs and directions before using the product. This product is designed and tested in accordance with international standards. The equipment should be used for the designated application only.

WARNING: DANGER OF ELECTRICAL SHOCK
The product is used in combination with a permanent energy source (battery). Even if the equipment is switched off, a dangerous electrical voltage can occur at the input and/or output terminals. Always switch the AC power off and disconnect the battery before performing maintenance.

The product contains no internal user-serviceable parts. Do not remove the front panel and do not put the product into operation unless all panels are fitted. All maintenance should be performed by qualified personnel.

Never use the product at sites where gas or dust explosions could occur. Refer to the specifications provided by the manufacturer of the battery to ensure that the battery is suitable for use with this product. The battery manufacturer's safety instructions should always be observed.

WARNING: do not lift heavy objects unassisted.

Installation

Read the installation instructions before commencing installation activities.

This product is a safety class I device (supplied with a ground terminal for safety purposes). Its AC input and/or output terminals must be provided with uninterruptible grounding for safety purposes. An additional grounding point is located on the outside of the product. If it can be assumed that the grounding protection is damaged, the product should be taken out of operation and prevented from accidentally being put into operation again; contact qualified maintenance personnel.

Ensure that the connection cables are provided with fuses and circuit breakers. Never replace a protective device by a component of a different type. Refer to the manual for the correct part.

Check before switching the device on whether the available voltage source conforms to the configuration settings of the product as described in the manual.

Ensure that the equipment is used under the correct operating conditions. Never operate it in a wet or dusty environment. Install the product in a heatproof environment. Ensure therefore that there are no chemicals, plastic parts, curtains or other textiles, etc. in the immediate vicinity of the equipment.

Transport and storage

On storage or transport of the product, ensure that the mains supply and battery leads are disconnected.

No liability can be accepted for damage in transit if the equipment is not transported in its original packaging.

Store the product in a dry environment; the storage temperature should range from –20°C to 60°C.

Refer to the battery manufacturer's manual for information on transport, storage, charging, recharging and disposal of the battery.
2. DESCRIPTION

2.1 In general

The basis of the MultiPlus is an extremely powerful sine inverter, battery charger and automatic switch in a compact casing. The MultiPlus features the following additional, often unique characteristics:

Automatic and uninterruptible switching
In the event of a supply failure or when the generating set is switched off, the MultiPlus will switch over to inverter operation and take over the supply of the connected devices. This is done so quickly that operation of computers and other electronic devices is not disturbed (Uninterruptible Power Supply or UPS functionality). This makes the MultiPlus highly suitable as an emergency power system in industrial and telecommunication applications. The maximum alternating current that can be switched is 16A or 50A, depending on model.

Auxiliary AC output
Besides the usual uninterruptable output, an auxiliary output is available that disconnects its load in the event of battery operation. Example: an electric boiler that is allowed to operate only if the genset is running or shore power is available.

Virtually unlimited power thanks to parallel operation
Up to 6 Multis can operate in parallel. Six units 24/3000/70, for example, will provide 15kW / 18kVA output power and 420 Amps charging capacity.

Three phase capability
Three units can be configured for three-phase output. But that’s not all: up to 6 sets of three units can be parallel connected to provide 45kW / 54kVA inverter power and more than 1000A charging capacity.

PowerControl – maximum use of limited shore current
The MultiPlus can supply a huge charging current. This implies heavy loading of the shore connection or generator set. Therefore a maximum current can be set. The MultiPlus then takes other power users into account, and only uses ‘surplus’ current for charging purposes.

PowerAssist – Extended use of your generator and shore current: the MultiPlus “co-supply” feature
This feature takes the principle of PowerControl to a further dimension allowing the MultiPlus to supplement the capacity of the alternative source. Where peak power is so often required only for a limited period, the MultiPlus will make sure that insufficient shore or generator power is immediately compensated for by power from the battery. When the load reduces, the spare power is used to recharge the battery.

This unique feature offers a definitive solution for the ‘shore current problem’: high power electric tools, dish washers, washing machines, electric cooking etc. can all run on 16A shore current, or even less. In addition, a smaller generator can be installed.

Three programmable relays
The relays can be programmed for all kinds of applications, for example as a starter relay for a generating set.

Two programmable analog/digital input/output ports
These ports can be used for several purposes. One application is communication with the BMS of a lithium-ion battery.

Frequency shift
When solar inverters are connected to the output of a Multi or Quattro, the excess solar energy is used to recharge the batteries. Once the absorption voltage is reached, the Multi or Quattro will shut down the solar inverter by shifting the output frequency 1Hz (from 50Hz to 51Hz for example). Once battery voltage has dropped slightly, the frequency returns to normal and the solar inverters will restart.

Built-in Battery Monitor (optional)
The ideal solution when Multis or Quattros are part of a hybrid system (diesel generator, inverter/chargers, storage battery, and alternative energy). The built-in battery monitor can be set to start and stop the generator:
- Start at a preset % discharge level, and/or
- start (with a preset delay) at a preset battery voltage, and/or
- start (with a preset delay) at a preset load level.
- Stop at a preset battery voltage, or
- stop (with a preset delay) after the bulk charge phase has been completed, and/or
- stop (with a preset delay) at a preset load level.

Solar energy
The MultiPlus is extremely suitable for solar energy applications. It can be used in autonomous systems as well as grid connected systems.
Autonomous operation when the grid fails

Houses or buildings with solar panels or a combined micro-scale heating and power plant or other sustainable energy sources have a potential autonomous energy supply which can be used for powering essential equipment (central heating pumps, refrigerators, deep freeze units, Internet connections, etc.) during a power failure. A problem is however that grid connected sustainable energy sources drop out as soon as the grid fails. With a MultiPlus and batteries, this problem can be solved in a simple manner: the MultiPlus can replace the grid during a power failure. When the sustainable energy sources produce more power than needed, the MultiPlus will use the surplus to charge the batteries; in the event of a shortfall, the MultiPlus will supply additional power from the battery.

Programmable with DIP switches, VE.Net panel or personal computer

The MultiPlus is supplied ready for use. Three features are available for changing certain settings if desired:
- The most important settings (including parallel operation of up to three devices and 3-phase operation) can be changed in a very simple manner, using DIP switches.
- All settings, with exception of the multi-functional relay, can be changed with a VE.Net panel.
- All settings can be changed with a PC and free of charge software, downloadable from our website [www.victronenergy.com](http://www.victronenergy.com).

2.2 Battery charger

Adaptive 4-stage charging characteristics: bulk – absorption – float – storage

The microprocessor-driven adaptive battery management system can be adjusted for various types of batteries. The adaptive function automatically adapts the charging process to battery use.

The right amount of charge: variable absorption time

In the event of slight battery discharge, absorption is kept short to prevent overcharging and excessive gas formation. After deep discharging, the absorption time is automatically extended in order to fully charge the battery.

Preventing damage due to excessive gassing: the BatterySafe mode

If, in order to quickly charge a battery, a high charge current in combination with a high absorption voltage has been chosen, damage due to excessive gassing will be prevented by automatically limiting the rate of voltage increase once the gassing voltage has been reached.

Less maintenance and aging when the battery is not in use: the Storage mode

The Storage mode kicks in whenever the battery has not been subjected to discharge during 24 hours. In the Storage mode float voltage is reduced to 2,2V/cell (13,2V for 12V battery) to minimise gassing and corrosion of the positive plates. Once a week the voltage is raised back to the absorption level to ‘equalize’ the battery. This feature prevents stratification of the electrolyte and sulphation, a major cause of early battery failure.

Two DC outputs for charging two batteries

The main DC terminal can supply the full output current. The second output, intended for charging a starter battery, is limited to 4A and has a slightly lower output voltage.

Increasing service life of the battery: temperature compensation

The temperature sensor (supplied with the product) serves to reduce charging voltage when battery temperature rises. This is particularly important for maintenance-free batteries, which could otherwise dry out by overcharging.

Battery voltage sense: the correct charge voltage

Voltage loss due to cable resistance can be compensated by using the voltage sense facility to measure voltage directly on the DC bus or on the battery terminals.

More on batteries and charging

Our book ‘Energy Unlimited’ offers further information on batteries and battery charging, and is available free of charge on our website (see [www.victronenergy.com → Support & Downloads → General Technical Information](http://www.victronenergy.com)). For more information on adaptive charging, please also refer to the General Technical Information our website.

2.3 Self consumption – solar energy storage systems

For more information see our white paper [Self Consumption or Grid independence with the Victron Energy Storage Hub](http://www.victronenergy.com/live/system_integration:hub4_grid_parallel).

The appropriate software can be downloaded from our website.

When the Multi/Quattro is used in a configuration in which it will feed back energy to the grid it is required to enable grid code compliance by selecting the grid code country setting with the VEConfigure tool. This way the Multi/Quattro can comply to the local rules.

Once set, a password will be required to disable grid code compliance or change grid code related parameters.

If the local grid code is not supported by the Multi/Quattro an external certified interface device should be used to connect the Multi/Quattro to the grid.

The Multi/Quattro can also be used as a bidirectional inverter operating parallel to the grid, integrated into a customer designed system (PLC or other) that takes care of the control-loop and grid measurement, see [http://www.victronenergy.com/live/system_integration:hub4_grid_parallel](http://www.victronenergy.com/live/system_integration:hub4_grid_parallel).

Special note for Australian customers: IEC62109.1 certification and CEC approval for off-grid use does NOT imply approval for grid-interactive installations. Additional certification to IEC 62109.2 and AS 4777.2-2015 are required before grid-interactive systems can be implemented. Please check Clean Energy Council website for current approvals.
3. OPERATION

3.1 On/Off/Charger Only Switch

When switched to "on", the product is fully functional. The inverter will come into operation and the LED "inverter on" will light up.

An AC voltage connected to the "AC in" terminal will be switched through to the "AC out" terminal, if within specifications. The inverter will switch off, the "mains on" LED will light up and the charger commences charging. The "bulk", "absorption" or "float" LEDs will light up, depending on the charger mode.

If the voltage at the "AC-in" terminal is rejected, the inverter will switch on.

When the switch is switched to "charger only", only the battery charger of the Multi will operate (if mains voltage is present). In this mode input voltage also is switched through to the "AC out" terminal.

NOTE: When only the charger function is required, ensure that the switch is switched to "charger only". This prevents the inverter from being switched on if the mains voltage is lost, thus preventing your batteries from running flat.

3.2 Remote control

Remote control is possible with a 3-way switch or with a Multi Control panel. The Multi Control panel has a simple rotary knob with which the maximum current of the AC input can be set: see PowerControl and PowerAssist in Section 2.

3.3 Equalisation and forced absorption

3.3.1 Equalisation

Traction batteries require regular additional charging. In the equalisation mode, the MultiPlus will charge with increased voltage for one hour (1V above the absorption voltage for a 12V battery, 2V for a 24V battery). The charging current is then limited to 1/4 of the set value. The "bulk" and "absorption" LEDs flash intermittently.

Equalisation mode supplies a higher charging voltage than most DC consuming devices can cope with. These devices must be disconnected before additional charging takes place.

3.3.2 Forced absorption

Under certain circumstances, it can be desirable to charge the battery for a fixed time at absorption voltage level. In Forced Absorption mode, the MultiPlus will charge at the normal absorption voltage level during the set maximum absorption time. The "absorption" LED lights.

3.3.3 Activating equalisation or forced absorption

The MultiPlus can be put into both these states from the remote panel as well as with the front panel switch, provided that all switches (front, remote and panel) are set to "on" and no switches are set to "charger only".

In order to put the MultiPlus in this state, the procedure below should be followed.

If the switch is not in the required position after following this procedure, it can be switched over quickly once. This will not change the charging state.

NOTE: Switching from "on" to "charger only" and back, as described below, must be done quickly. The switch must be toggled such that the intermediate position is 'skipped', as it were. If the switch remains in the "off" position even for a short time, the device may be turned off. In that case, the procedure must be restarted at step 1. A certain degree of familiarisation is required when using the front switch on the Compact in particular. When using the remote panel, this is less critical.

Procedure:

1. Check whether all switches (i.e. front switch, remote switch or remote panel switch if present) are in the "on" position.
2. Activating equalisation or forced absorption is only meaningful if the normal charging cycle is completed (charger is in 'Float').
3. To activate:
   a. Switch rapidly from "on" to "charger only" and leave the switch in this position for ½ to 2 seconds.
   b. Switch rapidly back from "charger only" to "on" and leave the switch in this position for ½ to 2 seconds.
   c. Switch once more rapidly from "on" to "charger only" and leave the switch in this position.
4. On the MultiPlus (and, if connected, on the MultiControl panel) the three LEDs "Bulk", "Absorption" and "Float" will now flash 5 times.
5. Subsequently, the LEDs "Bulk", "Absorption" and "Float" will each light during 2 seconds.
   a. If the switch is set to "on" while the "Bulk" LED lights, the charger will switch to equalisation.
   b. If the switch is set to "on" while the "Absorption" LED lights, the charger will switch to forced absorption.
   c. If the switch is set to "on" after the three LED sequence has finished, the charger will switch to "Float".
   d. If the switch has not been moved, the MultiPlus will remain in 'charger only' mode and switch to "Float".
### 3.4 LED Indications

- **LED off**
- **LED flashes**
- **LED illuminated**

#### Inverter

<table>
<thead>
<tr>
<th>Charger</th>
<th>Inverter</th>
</tr>
</thead>
<tbody>
<tr>
<td>mains on</td>
<td>inverter on</td>
</tr>
<tr>
<td>Bulk off</td>
<td>overload</td>
</tr>
<tr>
<td>Absorption off</td>
<td>low battery</td>
</tr>
<tr>
<td>Float</td>
<td>temperature</td>
</tr>
</tbody>
</table>

The inverter is on and supplies power to the load.

<table>
<thead>
<tr>
<th>Charger</th>
<th>Inverter</th>
</tr>
</thead>
<tbody>
<tr>
<td>mains on</td>
<td>inverter on</td>
</tr>
<tr>
<td>Bulk overload</td>
<td>low battery</td>
</tr>
<tr>
<td>absorption off</td>
<td>temperature</td>
</tr>
</tbody>
</table>

The nominal output of the inverter is exceeded. The "overload" LED flashes.

<table>
<thead>
<tr>
<th>Charger</th>
<th>Inverter</th>
</tr>
</thead>
<tbody>
<tr>
<td>mains on</td>
<td>inverter on</td>
</tr>
<tr>
<td>Bulk overload</td>
<td>low battery</td>
</tr>
<tr>
<td>absorption off</td>
<td>temperature</td>
</tr>
</tbody>
</table>

The inverter is switched off due to overload or short circuit.

<table>
<thead>
<tr>
<th>Charger</th>
<th>Inverter</th>
</tr>
</thead>
<tbody>
<tr>
<td>mains on</td>
<td>inverter on</td>
</tr>
<tr>
<td>Bulk low battery</td>

</tr>
<tr>
<td>Float</td>
<td></td>
</tr>
</tbody>
</table>

The battery is almost fully exhausted.

<table>
<thead>
<tr>
<th>Charger</th>
<th>Inverter</th>
</tr>
</thead>
<tbody>
<tr>
<td>mains on</td>
<td>inverter on</td>
</tr>
<tr>
<td>Bulk overload</td>
<td>low battery</td>
</tr>
<tr>
<td>absorption off</td>
<td>temperature</td>
</tr>
</tbody>
</table>

The inverter has switched off due to low battery voltage.

<table>
<thead>
<tr>
<th>Charger</th>
<th>Inverter</th>
</tr>
</thead>
<tbody>
<tr>
<td>mains on</td>
<td>inverter on</td>
</tr>
<tr>
<td>Bulk overload</td>
<td>low battery</td>
</tr>
<tr>
<td>absorption off</td>
<td>temperature</td>
</tr>
</tbody>
</table>

The internal temperature is reaching a critical level.
The inverter has switched off due to the electronics temperature being too high.

- If the LEDs are flashing alternately, the battery is nearly exhausted and the nominal output is exceeded.
- If "overload" and "low battery" flash simultaneously, the ripple voltage on the battery terminals is too high.

The inverter switched off due to excess ripple voltage on the battery terminals.

The mains voltage is switched through and the charger operates in absorption mode.

The mains voltage is switched through and the charger operates in absorption mode.

The AC input voltage is switched through and the charger operates in bulk mode.

The mains voltage is switched through and the charger is on.

The set absorption voltage, however, has not yet been reached. (BatterySafe mode)
### Special Indications

#### PowerControl

<td>Float</td>
<td>temperature</td>
</tr>
</tbody>
</table>

The mains voltage is switched through and the charger operates in equalize mode.

For more error codes see section 7.3
4. Installation

This product may only be installed by a qualified electrical engineer.

4.1 Location

The product must be installed in a dry and well-ventilated area, as close as possible to the batteries. There should be a clear space of at least 10cm around the appliance for cooling.

Excessively high ambient temperature will result in the following:
- Reduced service life.
- Reduced charging current.
- Reduced peak capacity, or shutdown of the inverter.
- Never position the appliance directly above the batteries.

The MultiPlus is suitable for wall mounting. For mounting purposes, a hook and two holes are provided at the back of the casing (see appendix G). The device can be fitted either horizontally or vertically. For optimal cooling, vertical fitting is preferred.

The interior of the product must remain accessible after installation.

Try and keep the distance between the product and the battery to a minimum in order to minimize cable voltage loss.

For safety purposes, this product should be installed in a heat-resistant environment. You should prevent the presence of e.g. chemicals, synthetic components, curtains or other textiles, etc., in the immediate vicinity.

4.2 Connection of battery cables

In order to utilize the full capacity of the product, batteries with sufficient capacity and battery cables with sufficient cross section should be used. See table.

<table>

</tbody>
</table>

* ‘2x’ means two positive and two negative cables.

Remark: Internal resistance is the important factor when working with low capacity batteries. Please consult your supplier or the relevant sections of our book “Energy Unlimited”, downloadable from our website.

Procedure

Proceed as follows to connect the battery cables:

Use a torque wrench with insulated box spanner in order to avoid shorting the battery.

**Recommended torque: 12 Nm**

Avoid shorting the battery cables.

- Undo the four screws at the front of the enclosure and remove the front panel.
- Connect the battery cables: see Appendix A.
- Tighten the nuts well for minimal contact resistance.
4.3 Connection of the AC cabling

The MultiPlus is a safety class I product (supplied with a ground terminal for safety purposes). Its AC input and/or output terminals and/or grounding point on the outside of the product must be provided with an uninterruptible grounding point for safety purposes.

The MultiPlus is provided with a ground relay (relay H, see appendix B) that automatically connects the Neutral output to the chassis if no external AC supply is available. If an external AC supply is provided, the ground relay H will open before the input safety relay closes. This ensures the correct operation of an earth leakage circuit breaker that is connected to the output.

─ In a fixed installation, an uninterrupted grounding can be secured by means of the grounding wire of the AC input. Otherwise the casing must be grounded.
─ In a mobile installation (for example, with a shore current plug), interrupting the shore connection will simultaneously disconnect the grounding connection. In that case, the casing must be connected to the chassis (of the vehicle) or to the hull or grounding plate (of the boat).

In case of a boat, direct connection to the shore ground is not recommended because of potential galvanic corrosion. The solution to this is using an isolation transformer.

The terminal blocks can be found on the printed circuit board, see Appendix A. The shore or mains cable must be connected to the Multi with the aid of a three-wire cable.

Recommended torque: 1.6 Nm

- **AC-in** (see appendix A)
The AC input cable can be connected to the terminal block “AC–in”. From left to right: “PE” (earth), “N” (neutral) and “L” (phase). The AC input must be protected by a fuse or magnetic circuit breaker rated at 50A or less, and cable cross-section must be sized accordingly. If the input AC supply is rated at a lower value, the fuse or magnetic circuit breaker should be down sized accordingly.

- **AC-out-1** (see appendix A)
The AC output cable can be connected directly to the terminal block "AC-out". With its PowerAssist feature the Multi can add up to 3kVA (that is 3000 / 230 = 13A) to the output during periods of peak power requirement. Together with a maximum input current of 50A this means that the output can supply up to 50 + 13 = 63A.

An earth leakage circuit breaker and a fuse or circuit breaker rated to support the expected load must be included in series with the output, and cable cross-section must be sized accordingly. The maximum rating of the fuse or circuit breaker is 63A.

- **AC-out-2** (see appendix A)
A second output is available that disconnects its load in the event of battery operation. On these terminals, equipment is connected that may only operate if AC voltage is available on AC-in, e.g. an electric boiler or an air conditioner.
The load on AC-out-2 is disconnected immediately when the MultiPlus switches to battery operation. After AC power becomes available on AC-in, the load on AC-out-2 will be reconnected with a delay of approximately 2 minutes. This to allow a genset to stabilise.
AC-out-2 can support loads of up to 25A. An earth leakage circuit breaker and fuse rated at max. 32A must be connected in series with AC-out-2.

**Note:** Loads connected to AC-out-2 will be taken into account in the PowerControl / PowerAssist current limit setting. Loads directly connected to the AC supply will not be included in the PowerControl / PowerAssist current limit setting.
4.4 Optional Connections

A number of optional connections are possible:

4.4.1 Second Battery
The MultiPlus has a connection for charging a starter battery. For connection see Appendix A.

4.4.2 Voltage Sense
For compensating possible cable losses during charging, two sense wires can be connected with which the voltage directly on the battery or on the positive and negative distribution points can be measured. Use wire with a cross-section of 0.75mm².

During battery charging, the MultiPlus will compensate the voltage drop over the DC cables up to a maximum of 1 Volt (i.e. 1V over the positive connection and 1V over the negative connection). If the voltage drop threatens to become larger than 1V, the charging current is limited in such a way that the voltage drop remains limited to 1V.

4.4.3 Temperature Sensor
The temperature sensor supplied with the product may be used for temperature-compensated charging (see Appendix A). The sensor is isolated and must be mounted on the batteries minus pole.

4.4.4 Remote Control
The product can be remotely controlled in two ways.
- With an external switch (connection terminal L, see appendix A). Operates only if the switch on the MultiPlus is set to “on”.
- With a Multi Control panel (connected to one of the two RJ48 sockets B, see appendix A). Operates only if the switch on the MultiPlus is set to “on”.

Only one remote control can be connected, i.e. either a switch or a Multi control panel.

4.4.5 Programmable relays
The relays can be programmed for all kinds of applications, for example as a starter relay for a generating set.

4.4.6 Programmable analog/digital input/output ports
These ports can be used for several purposes. One application is communication with the BMS of a lithium-ion battery.

4.4.7 Auxiliary AC output (AC-out-2)
Besides the usual uninterruptable output, a second output (AC-out-2) is available that disconnects its load in the event of battery operation. Example: an electric boiler or air conditioner that is allowed to operate only if the genset is running or shore power is available.

In case of battery operation, AC-out-2 is switched off immediately. After the AC supply has become available, AC-out-2 is reconnected with a delay of 2 minutes, this to allow a genset to stabilise prior to connecting a heavy load.

4.4.8 Parallel Connection
The MultiPlus can be connected in parallel with several identical devices. To this end, a connection is established between the devices by means of standard RJ45 UTP cables. The system (one or more Multis plus optional control panel) will require subsequent configuration (see Section 5).

In the event of connecting MultiPlus units in parallel, the following requirements must be met:
- A maximum of six units connected in parallel.
- Only identical devices may be connected in parallel.
- The DC connection cables to the devices must be of equal length and cross-section.
- If a positive and a negative DC distribution point is used, the cross-section of the connection between the batteries and the DC distribution point must at least equal the sum of the required cross-sections of the connections between the distribution point and the MultiPlus units.
- Place the MultiPlus units close to each other, but allow at least 10cm for ventilation purposes under, above and beside the units.
- UTP cables must be connected directly from one unit to the other (and to the remote panel). Connection/splitter boxes are not permitted.
- A battery-temperature sensor need only be connected to one unit in the system. If the temperature of several batteries is to be measured, you can also connect the sensors of other MultiPlus units in the system (with a maximum of one sensor per MultiPlus). Temperature compensation during battery charging responds to the sensor indicating the highest temperature.
- Voltage sensing must be connected to the master (see Section 5.5.1.4).
- Only one remote control means (panel or switch) can be connected to the system.

4.4.9 Three-phase operation
The MultiPlus can also be used in 3-phase wye (Y) configuration. To this end, a connection between the devices is made by means of standard RJ45 UTP cables (the same as for parallel operation). The system (Multis plus an optional control panel) will require subsequently configuration (see Section 5).

Pre-requisites: see Section 4.4.8.

Note: the MultiPlus is not suitable for 3-phase delta (Δ) configuration.
5. Configuration

- Settings may only be changed by a qualified electrical engineer.
- Read the instructions thoroughly before implementing changes.
- During setting of the charger, the AC input must be removed.

5.1 Standard settings: ready for use

On delivery, the MultiPlus is set to standard factory values. In general, these settings are suitable for single-unit operation.

Warning: Possibly, the standard battery charging voltage is not suitable for your batteries! Refer to the manufacturer's documentation, or to your battery supplier!

**Standard MultiPlus factory settings**

5.2 Explanation of settings

Settings that are not self-explanatory are described briefly below. For further information, please refer to the help files in the software configuration programs (see Section 5.3).

**Inverter frequency**

Output frequency if no AC is present at the input.
Adjustability: 50Hz; 60Hz

**Input frequency range**

Input frequency range accepted by the MultiPlus. The MultiPlus synchronises within this range with the AC input frequency. The output frequency is then equal to the input frequency.
Adjustability: 45 – 65Hz; 45 – 55Hz; 55 – 65Hz

**Input voltage range**

Voltage range accepted by the MultiPlus. The MultiPlus synchronises within this range with the AC input voltage. The output voltage is then equal to the input voltage.
Adjustability: Lower limit: 94 - 120V
Upper limit: 120 - 143V

**Note:** the standard lower limit setting of 94V is intended for connection to a weak mains supply, or to a generator with unstable AC output. This setting may result in a system shut down when connected to a 'brushless, self excited, externally voltage regulated, synchronous AC generator' (synchronous AVR generator). Most generators rated at 10kVA or more are synchronous AVR generators. The shut down is initiated when the generator is stopped and revs down while the AVR simultaneously 'tries' to keep the output voltage of the generator at 120V.

The solution is to increase the lower limit setting to 110VAC (the output of AVR generators is generally very stable), or to disconnect the Multi(s) from the generator when a generator stop signal is given (with help of an AC contactor installed in series with the generator).
Inverter voltage
Output voltage of the MultiPlus in battery operation.
Adjustability: 95 – 128V

Stand-alone / parallel operation / 2-3 phase setting
Using several devices, it is possible to:
- increase total inverter power (several devices in parallel)
- create a split-phase system by stacking (only for MultiPlus units with 120V output voltage)
- create a split-phase system with a separate autotransformer: see VE autotransformer datasheet and manual
- create a 3-phase system.

The standard product settings are for standalone operation. For parallel, three phase or split phase operation see sections 5.3 / 5.4 and 5.5.

AES (Automatic Economy Switch)
If this setting is turned ‘on’, the power consumption in no-load operation and with low loads is decreased by approx. 20%, by slightly ‘narrowing’ the sinusoidal voltage. Applicable in stand-alone configuration only.

Search Mode
Instead of the AES mode, the search mode can also be chosen (with help of VEConfigure only). If search mode is ‘on’, the power consumption in no-load operation is decreased by approx. 70%. In this mode the MultiPlus, when operating in inverter mode, is switched off in case of no load or very low load, and switches on every two seconds for a short period. If the output current exceeds a set level, the inverter will continue to operate. If not, the inverter will shut down again.
The Search Mode “shut down” and “remain on” load levels can be set with VEConfigure.
The standard settings are:
Shut down: 40 Watt (linear load)
Turn on: 100 Watt (linear load)
Not adjustable with DIP switches. Applicable in stand-alone configuration only.

Ground relay (see appendix B)
With this relay (H), the neutral conductor of the AC output is grounded to the chassis when the back feed safety relay is open. This ensures the correct operation of earth leakage circuit breakers in the output.
- If a non-grounded output is required during inverter operation, this function must be turned off, see appendix A.
  Not adjustable with DIP switches.
- Models with 50A transfer capacity only: if required an external ground relay can be connected (for a split-phase system with a separate autotransformer).
  See appendix A.

Battery charge curve
The standard setting is ‘Four-stage adaptive with BatterySafe mode’. See Section 2 for a description.
This is the best charging characteristic. See the help files in the software configuration programs for other features.
‘Fixed’ mode can be selected with DIP switches.

Battery type
The standard setting is the most suitable for Victron Gel Deep Discharge, Gel Exide A200, and tubular plate stationary batteries (OPzS).
This setting can also be used for many other batteries: e.g. Victron AGM Deep Discharge and other AGM batteries, and many types of flat-plate open batteries. Four charging voltages can be set with DIP switches.
With VEConfigure the charge curve can be adjusted to charge any battery type (Nickel Cadmium batteries, Lithium-ion batteries)

Automatic equalisation charging
This setting is intended for flooded tubular plate traction or OPzS batteries. During absorption the voltage limit increases to 2.83V/cell (34V for a 24V battery) once the charge current has tapered down to less than 10% of the set maximum current.
Not adjustable with DIP switches.
See ‘tubular plate traction battery charge curve’ in VEConfigure.

Absorption time
The absorption time depends on the bulk time (adaptive charge curve), so that the battery is optimally charged. If the ‘fixed’ charging characteristic is selected, the absorption time is fixed. For most batteries, a maximum absorption time of eight hours is suitable. If an extra high absorption voltage is selected for rapid charging (only possible for open, flooded batteries!), four hours is preferable. With DIP switches, a time of eight or four hours can be set. For the adaptive charge curve, this determines the maximum absorption time.

Storage voltage, Repeated Absorption Time, Absorption Repeat Interval
See Section 2. Not adjustable with DIP switches.

Bulk Protection
When this setting is ‘on’, the bulk charging time is limited to 10 hours. A longer charging time could indicate a system error (e.g. a battery cell short-circuit). Not adjustable with DIP switches.
AC input current limit
These are the current limit settings for which PowerControl and PowerAssist come into operation.
PowerAssist setting range:
From 7.5A* to 50A.
Factory setting: the maximum value (50A).
See Section 2, the book 'Energy Unlimited', or the many descriptions of the unique PowerAssist feature on our website www.victronenergy.com.
* Applies only when PowerAssist is enabled

AC input current limit
These are the current limit settings for which PowerControl and PowerAssist come into operation.
PowerAssist setting range:
From 5.3A to 50A for models with 50A transfer capacity
Factory setting: the maximum value (50A).
See Section 2, the book 'Energy Unlimited', or the many descriptions of this unique feature on our website www.victronenergy.com.

UPS feature
If this setting is ‘on’ and AC on the input fails, the MultiPlus switches to inverter operation practically without interruption. The MultiPlus can therefore be used as an Uninterruptible Power Supply (UPS) for sensitive equipment such as computers or communication systems.
The output voltage of some small generator sets is too unstable and distorted for using this setting – the MultiPlus would continually switch to inverter operation. For this reason, the setting can be turned off. The MultiPlus will then respond less quickly to AC input voltage deviations. The switchover time to inverter operation is consequently slightly longer, but most equipment (most computers, clocks or household equipment) is not adversely impacted.
Recommendation: Turn the UPS feature off if the MultiPlus fails to synchronise, or continually switches back to inverter operation.

Dynamic current limiter
Intended for generators, the AC voltage being generated by means of a static inverter (so-called ‘inverter’ generators). In these generators, rpm is down-controlled if the load is low: this reduces noise, fuel consumption and pollution. A disadvantage is that the output voltage will drop severely or even completely fail in the event of a sudden load increase. More load can only be supplied after the engine is up to speed.
If this setting is ‘on’, the MultiPlus will start supplying extra power at a low generator output level and gradually allow the generator to supply more, until the set current limit is reached. This allows the generator engine to get up to speed.
This setting is also often used for ‘classical’ generators that respond slowly to sudden load variation.

WeakAC
Strong distortion of the input voltage can result in the charger hardly operating or not operating at all. If WeakAC is set, the charger will also accept a strongly distorted voltage, at the cost of greater distortion of the input current.
Recommendation: Turn WeakAC on if the charger is hardly charging or not charging at all (which is quite rare!). Also turn on the dynamic current limiter simultaneously, and reduce the maximum charging current to prevent overloading the generator if necessary.
Note: when WeakAC is on, the maximum charge current is reduced by approximately 20%.
Not adjustable with DIP switches.

BoostFactor
Change this setting only after consulting with Victron Energy or with an engineer trained by Victron Energy!
Not adjustable with DIP switches.

Three programmable relays
The MultiPlus is equipped with 3 programmable relays. The relays can be programmed for all kinds of other applications, for example as a starter relay for a generating set. The default setting of the relay in position I (see appendix A, upper right corner) is ‘alarm’.
Not adjustable with DIP switches.

Auxiliary AC output (AC-out-2)
Besides the uninterruptable output, a second output (AC-out-2) is available that disconnects its load in the event of battery operation.
Example: an electric boiler or air conditioner that is allowed to operate only if the genset is running or shore power is available.
In case of battery operation, AC-out-2 is switched off immediately. After the AC supply has become available, AC-out-2 is reconnected with a delay of 2 minutes, this to allow a genset to stabilise prior to connecting a heavy load.
5.3 Configuration by computer

All settings can be changed by means of a computer or with a VE.Net panel (except for the multi-functional relay and the VirtualSwitch when using VE.Net).
The most common settings can be changed by means of DIP switches (see Section 5.5).

NOTE:
This manual is intended for products with firmware xxxx400 or higher (with x any number)
The firmware number can be found on the microprocessor, after removing the front panel.
It is possible to update older units, as long as that same 7 digit number starts with either 26 or 27. When it starts with 19 or 20 you have an old microprocessor and it is not possible to update to 400 or higher.

For changing settings with the computer, the following is required:
- VEConfigure3 software: can be downloaded free of charge at www.victronenergy.com.
- A MK3-USB (VE.Bus to USB) interface, and a RJ45 UTP cable.
  Alternatively, the Interface MK2.2b (VE.Bus to RS232) and a RJ45 UTP cable can be used.

5.3.1 VE.Bus Quick Configure Setup
VE.Bus Quick Configure Setup is a software program with which systems with a maximum of three Multis (parallel or three phase operation) can be configured in a simple manner. VEConfigure3 forms part of this program.
The software can be downloaded free of charge at www.victronenergy.com.

5.3.2 VE.Bus System Configurator
For configuring advanced applications and/or systems with four or more Multis, VE.Bus System Configurator software must be used.
The software can be downloaded free of charge at www.victronenergy.com . VEConfigure3 forms part of this program.

5.3.3 More software
Several other software tools are available:
- Assistants: to configure Multis and Quattro for particular applications (such as self-consumption applications).
- Apps: to help managing and monitoring a system with a smart phone or tablet (see Support → Software on our website, ColorControl panel needed).
- VRM (Victron Remote Monitoring website): numerical and graphical display of system parameters and history (ColorControl or Venux GX needed).
- Remote VE Configure: to configure or change settings of a system remotely (ColorControl or Venux GX needed).
- The Multi/Quattro can also be used as a bidirectional inverter operating parallel to the grid, integrated into a customer designed system (PLC or other) that takes care of the control-loop and grid measurement, see http://www.victronenergy.com/live/system_integration:hub4_grid_parallel

5.4 Configuration with a VE.Net panel

To this end, a VE.Net panel and the VE.Net to VE.Bus converter is required.
With VE.Net all parameters are accessible, with the exception of the multi-functional relay and the VirtualSwitch.
5.5 Configuration with DIP switches

A number of settings can be changed using DIP switches (see appendix A, position M).

A number of settings can be changed using DIP switches (see appendix A, position M).

Note: When changing settings with DIP switches in a parallel or split-phase/3-phase system one should be aware that not all settings are relevant on all Multis. This because some settings will be dictated by the Master or Leader.

Some settings are only relevant in the Master/Leader (ie they are not relevant in a slave or in a follower). Other settings are not relevant for slaves but are relevant for followers.

A note on used terminology:
A system in which more than one Multi is used to create a single AC phase is called a parallel system. In this case one of the Multis will control the whole phase, this one is called the master. The others, called slaves, will just listen to the master to determine their action.

It is also possible to create more AC phases (split-phase or 3-phase) with 2 or 3 Multis. In this case the Multi in phase L1 is called the Leader. The Multis in phase L2 (and L3 if available) will generate the same AC frequency but will follow L1 with a fixed phase shift. These Multis are called followers.

If more Multis are used per phase in a split-phase or 3-phase system (for instance 6 Multis used to build a 3-phase system with 2 Multis per phase) then the Leader of the system is also the Master of phase L1. The Followers in phase L2 and L3 will also take the Master role in phase L2 and L3. All others will be slaves.

Setting up parallel or split-phase/3-phase systems should be done by software, see paragraph 5.3.

TIP: If you don’t want to bother about a Multi being a master/slave/follower then the easiest and most straight forward way is to set all settings identically on all Multis.

General procedure:

Turn the Multi on, preferably without load and without AC voltage on the input. The Multi will then operate in inverter mode.

**Step 1**: Set the DIP switches for:
- the required current limitation of the AC input (not relevant for slaves)
- AES (Automatic Economy Switch) (only relevant in systems with 1 Multi per phase)
- limitation of the charging current (only relevant for Master/Leader)

Press the ‘Up’ button for 2 seconds (upper button to the right of the DIP switches, see appendix A, position K) to store the settings after the required values have been set. You can now re-use the DIP switches to apply the remaining settings (step 2).

**Step 2**: other settings, set the dipswitches for:
- Charge voltages (only relevant for Master/Leader)
- Absorption time (only relevant for Master/Leader)
- Adaptive charging (only relevant for Master/Leader)
- Dynamic current limiter (not relevant for slaves)
- UPS function (not relevant for slaves)
- converter voltage (not relevant for slaves)
- converter frequency (only relevant for Master/Leader)

Press the ‘Down’ button for 2 seconds (lower button to the right of the DIP switches) to store the settings after the DIP switches have been set in the correct position. You can now leave the DIP switches in the selected positions, so that the ‘other settings’ can always be recovered.

Remarks:
- The DIP switch functions are described in 'top to bottom' order. Since the uppermost DIP switch has the highest number (8), descriptions start with the switch numbered 8.
- For parallel or 3-phase mode, read the whole setting procedure and make a note of the required DIP switch settings before actually implementing them.

Detailed instruction:

5.5.1 Step 1
5.5.1.1 Current limitation AC input (default: 50A)
If the current demand (Multi load + battery charger) threatens to exceed the set current, the MultiPlus will first reduce its charging current (PowerControl), and subsequently supply additional power from the battery (PowerAssist), if needed.

The AC input current limit can be set to eight different values by means of DIP switches. With a Multi Control Panel, a variable current limit can be set for the AC input.
Procedure
The AC input current limit can be set using DIP switches ds8, ds7 and ds6 (default setting: 50A).

Procedure: set the DIP switches to the required value:

- **ds8**  **ds7**  **ds6**
  - off  off  off = 6.3A
  - off  off  on = 10A
  - off  on  off = 12A
  - off  on  on = 16A
  - on  off  off = 20A
  - on  off  on = 25A
  - on  on  off = 30A
  - on  on  on = 50A

Remark: Manufacturer-specified continuous power ratings for small generators are sometimes inclined to be rather optimistic. In that case, the current limit should be set to a much lower value than would otherwise be required on the basis of manufacturer-specified data.

5.5.1.2 AES (Automatic Economy Switch)
Procedure: set ds5 to the required value:

- **ds5**
  - off = AES off
  - on = AES on

Note: The AES option is only effective if the unit is used 'stand alone'.

5.5.1.3 Battery charge current limitation (default setting 75%)
For maximum battery life, a charge current of 10% to 20% of the capacity in Ah should be applied.

Example: optimal charge current of a 24V/500Ah battery bank: 50A to 100A.

The temperature sensor supplied automatically adjusts the charge voltage to the battery temperature.

If faster charging – and a subsequent higher current – is required:
- The temperature sensor supplied should always be fitted, since fast charging can lead to a considerable temperature rise of the battery bank. The charge voltage will be adapted to the higher temperature (i.e. lowered) by means of the temperature sensor.
- The bulk charge time will sometimes be so short that a fixed absorption time would be more satisfactory (‘fixed’ absorption time, see ds5, step 2).

Procedure
The battery charge current can be set in four steps, using DIP switches ds4 and ds3 (default setting: 75%).

- **ds4**  **ds3**
  - off  off = 25%
  - off  on = 50%
  - on  off = 75%
  - on  on = 100%

Note: when WeakAC is on, the maximum charge current is reduced from 100% to approximately 80%.

5.5.1.4 DIP switches ds2 and ds1 are not used during step 1.

IMPORTANT NOTE:
If the last 3 digits of the Multi firmware is in the 100 range (so the firmware number is xxxx1xx (with x any numer)) then ds1 & ds2 are used to set a Multi in stand-alone, parallel or three-phase. Please consult the appropriate manual.
5.5.1.5 Examples

examples of settings:

</tr>
</tbody>
</table>

Step 1, stand-alone
Example 1 (factory setting):
- DS-8, DS-7, DS-6 AC-in: 50A
- DS-5 AES: off
- DS-4, DS-3 Charge: 75%
- DS-2, DS-1 Stand-alone mode

Example 2:
- DS-8, DS-7, DS-6 AC-in: 50A
- DS-5 AES: off
- DS-4, DS-3 Charge: 100%
- DS-2, DS-1 Stand-alone mode

Example 3:
- DS-8, DS-7, DS-6 AC-in: 16A
- DS-5 AES: off
- DS-4, DS-3 Charge: 100%
- DS-2, DS-1 Stand-alone mode

Example 4:
- DS-8, DS-7, DS-6 AC-in: 30A
- DS-5 AES: on
- DS-4, DS-3 Charge: 50%
- DS-2, DS-1 Stand-alone mode

To store the settings after the required values have been set: press the ‘Up’ button for 2 seconds (upper button to the right of the DIP switches, see appendix A, position J). The overload and low-battery LEDs will flash to indicate acceptance of the settings.

We recommend making a note of the settings, and filing this information in a safe place.

The DIP switches can now be used to apply the remaining settings (step 2).

5.5.2 Step 2: Other settings
The remaining settings are not relevant (na) for slaves.
Some of the remaining settings are not relevant for followers (L2, L3). These settings are imposed on the whole system by the leader L1. If a setting is irrelevant for L2, L3 devices, this is mentioned explicitly.

ds8-ds7: Setting charging voltages (not relevant for L2, L3)

</tbody>
</table>

ds6: absorption time 8 or 4 hours (na for L2, L3) on = 8 hours off = 4 hours

ds5: adaptive charging characteristic (na for L2, L3) on = active off = inactive (inactive = fixed absorption time)

ds4: dynamic current limiter on = active off = inactive

ds3: UPS function on = active off = inactive

ds2: converter voltage on = 115V off = 120V

(ds the wide input frequency range (45-55Hz) is ‘on’ by default)

Note:
- If “adaptive charging algorithm” is on, ds6 sets the maximum absorption time to 8 hours or 4 hours.
- If “adaptive charging algorithm” is off, the absorption time is set to 8 hours or 4 hours (fixed) by ds6.)
Step 2: Exemplary settings
Example 1 is the factory setting (since factory settings are entered by computer, all DIP switches of a new product are set to ‘off’ and do not reflect the actual settings in the microprocessor).

To store the settings after the required values have been set: press the ‘Down’ button for 2 seconds (lower button to the right of the DIP switches). The temperature and low-battery LEDs will flash to indicate acceptance of the settings.

The DIP switches can be left in the selected positions, so that the ‘other settings’ can always be recovered.
6. Maintenance

The MultiPlus does not require specific maintenance. It will suffice to check all connections once a year. Avoid moisture and oil/soot/vapours, and keep the device clean.

7. Error indications

With the procedures below, most errors can be quickly identified. If an error cannot be resolved, please refer to your Victron Energy supplier.

7.1 General error indications

7.2 Special LED indications

(for the normal LED indications, see section 3.4)

<table>
<thead>
<tr>
<th>Bulk and absorption LEDs flash synchronously (simultaneously).</th>
<th>Voltage sense error. The voltage measured at the voltage sense connection deviates too much (more than 7V) from the voltage on the positive and negative connection of the device. There is probably a connection error. The device will remain in normal operation. NOTE: If the &quot;inverter on&quot; LED flashes in phase opposition, this is a VE.Bus error code (see further on).</th>
</tr>
</thead>
<tbody>
<tr>
<td>Absorption and float LEDs flash synchronously (simultaneously).</td>
<td>The battery temperature as measured has an extremely unlikely value. The sensor is probably defective or has been incorrectly connected. The device will remain in normal operation. NOTE: If the &quot;inverter on&quot; LED flashes in phase opposition, this a VE.Bus error code (see further on).</td>
</tr>
<tr>
<td>&quot;Mains on&quot; flashes and there is no output voltage.</td>
<td>The device is in &quot;charger only&quot; operation and mains supply is present. The device rejects the mains supply or is still synchronising.</td>
</tr>
</tbody>
</table>

7.3 VE.Bus LED indications

Equipment included in a VE.Bus system (a parallel or 3-phase arrangement) can provide so-called VE.Bus LED indications. These LED indications can be subdivided into two groups: OK codes and error codes.

7.3.1 VE.Bus OK codes

If the internal status of a device is in order but the device cannot yet be started because one or more other devices in the system indicate an error status, the devices that are in order will indicate an OK code. This facilitates error tracing in a VE.Bus system, since devices not requiring attention are easily identified as such.

Important: OK codes will only be displayed if a device is not in inverter or charging operation!

- A flashing "bulk" LED indicates that the device can perform inverter operation.
- A flashing "float" LED indicates that the device can perform charging operation.

NOTE: In principle, all other LEDs must be off. If this is not the case, the code is not an OK code. However, the following exceptions apply:

- The special LED indications above can occur together with the OK codes.
- The "low battery" LED can function together with the OK code that indicates that the device can charge.

7.3.2 VE.Bus error codes

A VE.Bus system can display various error codes. These codes are displayed with the "inverter on", "bulk", "absorption" and "float" LEDs.

To interpret a VE.Bus error code correctly, the following procedure should be followed:

1. The device should be in error (no AC output).
2. Is the "inverter on" LED flashing? If not, then there is no VE.Bus error code.
3. If one or more of the LEDs "bulk", "absorption" or "float" flashes, then this flash must be in phase opposition to the "inverter on" LED, i.e. the flashing LEDs are off if the "inverter on" LED is on, and vice versa. If this is not the case, then there is no VE.Bus error code.
4. Check the "bulk" LED, and determine which of the three tables below should be used.
5. Select the correct column and row (depending on the "absorption" and "float" LEDs), and determine the error code.
6. Determine the meaning of the code in the tables below.
All of the conditions below must be met:

1. The device is in error! (No AC output)
2. Inverter LED flashes (in opposition to any flashing of the Bulk, Absorption or Float LED)
3. At least one of the LEDs Bulk, Absorption and Float is on or flashing

1) Can be adjusted to 50Hz;
2) Protection:
   a. Output short circuit
   b. Overload
   c. Battery voltage too high
   d. Battery voltage too low
   e. Temperature too high
   f. 120VAC on inverter output
   g. Input voltage ripple too high
3) Non linear load, crest factor 3:1
4) At 25°C ambient
5) Programmable relay which can be set for general alarm, DC undervoltage or genset start/stop function

APPENDIX E: Charge algorithm

4-stage charging:

**Bulk**
Entered when charger is started. Constant current is applied until nominal battery voltage is reached, depending on temperature and input voltage, after which constant power is applied up to the point where excessive gassing is starting (14.4V resp. 28.8V, temperature compensated).

**Battery Safe**
The applied voltage to the battery is raised gradually until the set Absorption voltage is reached. The Battery Safe Mode is part of the calculated absorption time.

**Absorption**
The absorption period is dependent on the bulk period. The maximum absorption time is the set Maximum Absorption time.

**Float**
Float voltage is applied to keep the battery fully charged.

**Storage**
After one day of float charge the output voltage is reduced to storage level. This is 13.2V resp. 26.4V (for 12V and 24V charger). This will limit water loss to a minimum when the battery is stored for the winter season. After an adjustable time (default = 7 days) the charger will enter Repeated Absorption-mode for an adjustable time (default = one hour) to refresh the battery.
APPENDIX F: Temperature compensation

**Battery temperature**
Default output voltages for Float and Absorption are at 25°C. Reduced Float voltage follows Float voltage and Raised Absorption voltage follows Absorption voltage. In adjust mode temperature compensation does not apply.
APPENDIX G: Dimensions
